Date	Version	Changed by	Change Description	
01.12.2011	4.2.0	AUTOSAR Administration	<ul> <li>Change interaction with BswM module for mode management</li> <li>Change of callout configuration management for services and subservices processing</li> <li>Synchronous and asynchronous clarification</li> </ul>	
24.11.2010	4.1.0	AUTOSAR Administration	<ul> <li>ComM_DCM_InactiveDiagnostic and ComM_DCM_ActiveDiagnostic has been defined as mandatory interfaces.</li> <li>DcmDsIPeriodicTxConfirmationPduId multiplicity changed and creation of DcmDsIPeriodicConnection parameter in order to link the confirmation Id with TxPdu Id for PeriodicTransmission.</li> <li>Dem_GetDTCOfOBDFreezeFrame, DIt_ConditionCheckRead added as optional interfaces</li> <li>DspInternal_<diagnosticservice> Api moved to mandatory internal interface to support the ECU Supplier diagnosis.</diagnosticservice></li> <li>Rework of ReadData operation</li> </ul>	

	Document Change History			
Date		Changed by	Change Description	
08.12.2009	4.0.0	AUTOSAR Administration	<ul> <li>Add support of following UDS services: ReadMemoryByAdress, WriteMemoryByAdress, RequestDownload, RequestUpload, TransferData, RequestTransferExit, CommunicationControl, ResponseOnEvent.</li> <li>Add of bootloader interaction</li> <li>Add of BswM interaction</li> <li>Add of IoHwAb interaction</li> <li>Add of DLT interaction</li> <li>Add of Signal based approach on RTE interfaces</li> <li>Legal □nvocation revised</li> </ul>	
06.08.2008	3.1.0	AUTOSAR Administration	<ul> <li>Introduction of OBD support</li> <li>generation of artefacts from the models according to the AUTOSAR process</li> <li>Identification of requirements and correct formulation of specification items as requirements</li> <li>General cleanup</li> <li>Legal □nvocation revised</li> </ul>	
28.11.2007	3.0.0	AUTOSAR Administration	<ul> <li>Rework of the interfaces with RTE (remove of Central Diagnostic SWC concept)</li> <li>Correction of issues identified on R2.1</li> <li>Document meta information extended</li> <li>Small layout adaptations made</li> </ul>	
24.01.2007	2.1.1	AUTOSAR Administration	<ul><li> "Advice for users" revised</li><li> "Revision Information" added</li></ul>	
05.12.2006	2.1.0	AUTOSAR Administration	<ul> <li>Corrections in configuration chapter</li> <li>Rework on interface between DCM and DEM according to changes in DEM SWS</li> <li>Corrections in Sequence diagram</li> <li>Addition of header files inclusions</li> <li>Legal disclaimer revised</li> </ul>	
29.06.2006	2.0.1	AUTOSAR Administration	Layout Adaptations	
26.04.2006	2.0.0	AUTOSAR Administration	<ul> <li>Document structure adapted to common Release 2.0 SWS Template.</li> <li>Major changes in chapter 10</li> <li>Structure of document changed partly</li> <li>Other changes see chapter 11</li> </ul>	
10.07.2005	1.0.0	AUTOSAR Administration	Initial release	

#### **Disclaimer**

This specification and the material contained in it, as released by AUTOSAR is for the purpose of information only. AUTOSAR and the companies that have contributed to it shall not be liable for any use of the specification.

The material contained in this specification is protected by copyright and other types of Intellectual Property Rights. The commercial exploitation of the material contained in this specification requires a license to such Intellectual Property Rights.

This specification may be utilized or reproduced without any modification, in any form or by any means, for informational purposes only.

For any other purpose, no part of the specification may be utilized or reproduced, in any form or by any means, without permission in writing from the publisher.

The AUTOSAR specifications have been developed for automotive applications only. They have neither been developed, nor tested for non-automotive applications.

The word AUTOSAR and the AUTOSAR logo are registered trademarks.

#### Advice for users

AUTOSAR Specification Documents may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software).

Any such exemplary items are contained in the Specification Documents for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such Specification Documents, nor any later documentation of AUTOSAR conformance of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

### **Known limitations**

The following limitations apply when using the DCM module:

- The DCM module does not provide any diagnostic multi-channel capabilities. This means that parallel requests of a tester addressed to different independent functionalities cannot be processed by a single DCM module. Furthermore, the concept currently implemented does not take more than one instance of a DCM module residing in one ECU into account. As the legislator requires that emission-related service requests according to ISO15031-5 [15] shall be processed prior to any enhanced diagnostic requests, the DCM module provides a protocol switching mechanism based on protocol prioritization.
- UDS Service AccessTimingParameter (0x83) is not supported by the ISO standards in CAN and LIN. Also it is not planned to support this service with FlexRay. Therefore no support for this service is planned.
- Subfunction onComparisionOfValues of Service ResponseOnEvent is not supported in the current release.
- Subfunction on TimerInterrupt of Service Response On Event is limited to the resolution of the MainFunction call.
- UDS Service SecuredDataTransmission (0x84) is not supported in the current release.
- The DCM SWS does not cover any SAE J1939 related diagnostic requirements.
- Due to DEM limitation, the diagnostic service \$19 05 is limited to the OBD legislative freeze frame.
- Management of IOControl service without InputOutputControlParameter in request and response is not supported
- The length of controlState parameter in IOControl request and response has to be of same size (due to the one configuration parameter DcmDspDataSize)
- Same layout of a DID which is used in RDBI, WDBI or IOCBI services

#### Introduction and functional overview

The DCM SWS describes the functionality, the API, and the configuration of the AUTOSAR Basic Software module DCM (Diagnostic Communication Manager). The DCM module provides a common API for diagnostic services. The functionality of the DCM module is used by external diagnostic tools during the development, manufacturing or service.

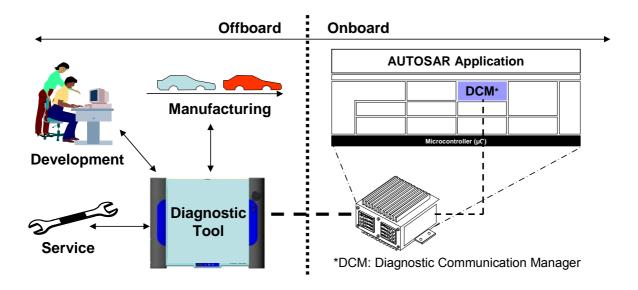

Figure 1 Overview of the communication between the external diagnostic tools and the onboard AUTOSAR Application

The DCM module ensures diagnostic data flow and manages the diagnostic states, especially diagnostic sessions and security states. Furthermore, the DCM module checks if the diagnostic service request is supported and if the service may be executed in the current session according to the diagnostic states. The DCM module provides the OSI-Layers 5 to 7 of Table 1 Diagnostic protocols and OSI-Layer.

OSI- Layer			Protoco	ols	
7	UDS-Protocol – ISO	14229-1			Legislated OBD – ISO15031-5
6	-	-	-	-	-
5	ISO15765-3	-	-	-	ISO 15765-4
4	ISO15765-2	-	-	-	-
3	ISO15765-2	-	-	-	ISO 15765-4
2	CAN-Protocol	LIN- Protocol	FlexRay	MOST	ISO 15765-4
1	CAN-Protocol	LIN- Protocol	FlexRay	MOST	ISO 15765-4

Table 1 Diagnostic protocols and OSI-Layers

At OSI-level 7, the DCM module provides an extensive set of ISO14229-1 [14] services. In addition, the DCM module provides mechanisms to support the OBD services \$01 - \$0A defined in documents [19] and [15]. With these services, Autosar OBD functionality is capable of meeting all light duty OBD regulations worldwide (California OBDII, EOBD, Japan OBD, and all others).

At OSI-level 5, the DCM module handles the network-independent sections of the following specifications:

- ISO15765-3 [17]: Implementation of unified diagnostic services (UDS on CAN)
- ISO15765-4 [18]: Requirements for emission-related systems, Chapter 5 "Session Layer"

In the AUTOSAR Architecture the Diagnostic Communication Manager is located in the Communication Services (Service Layer).

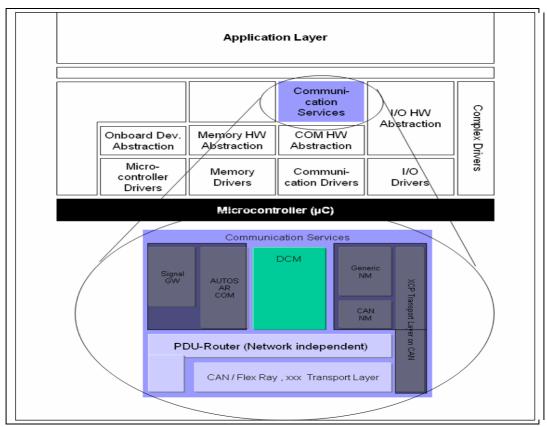

Figure 2 Position of the DCM module in AUTOSAR Architecture

The DCM module is network-independent. All network-specific functionality (the specifics of networks like CAN, LIN, FlexRay or MOST) is handled outside of the DCM module. The PDU Router (PduR) module provides a network-independent interface to the DCM module.

The DCM module receives a diagnostic message from the PduR module. The DCM module processes and checks internally the diagnostic message. processing the requested diagnostic service, the DCM will interact with other BSW modules or with SW-Components (through the RTE) to obtain requested data or to execute requested commands. This processing is very service-specific. Typically,

the DCM will assemble the gathered information and send a message back through the PduR module.

# 2 Acronyms and abbreviations

## 2.1 Terms

Term	Description
Application Layer	The Application Layer is placed above the RTE. Within the Application Layer the AUTOSAR Software-Components are placed.
Channel	A link at which a data transfer can take place. If there is more than one Channel, there is normally some kind of ID assigned to the Channel.
Diagnostic Channel	A link at which a data transfer between a diagnostic tool and an ECU can take place. Example: An ECU is connected via CAN and the diagnostic channel has an assigned CAN-ID. Diagnostic channels connected to other bus-systems such as MOST, FlexRay, LIN, etc. are also possible.
External Diagnostic Tool	A device which is NOT permanently connected to the vehicle communication network. This External Diagnostic Tool can be connected to the vehicle for various purposes, as e.g. for: <ul> <li>development,</li> <li>manufacturing, and</li> <li>service (in a garage).</li> </ul> <li>Example External Diagnostic Tools are:         <ul> <li>a diagnostic tester,</li> <li>an OBD scan tool.</li> </ul> </li> <li>The External Diagnostic Tool is to be connected by a mechanic to gather information from "inside" the car.</li>
Freeze Frame	A set of the vehicle/system operation conditions at a specific time.
Functional Addressing	The diagnostic communication model where a group or all nodes of a specific communication network receive a message from one sending node (1-n communication). This model is also referred to as 'broadcast' or 'multicast'. OBD communication will always be done in the Functional Addressing mode.
Internal Diagnostic Tool	A device/ECU which is connected to the vehicle communication network. The Internal Diagnostic Tool can be used for: advanced event tracking, advanced analysis, for service.  The behavior of the Internal Diagnostic Tool can be the same as of an External Diagnostic Tool. The notion of "Internal Diagnostic Tool" does not imply that it is included in each ECU as an AUTOSAR Software-Component.
Physical Addressing	The diagnostic communication model where a node of a specific communication network receives a message from one sending node (1-1 communication). This model is also referred to as 'unicast'.
UDS Service	this refers to a UDS Service as defined in ISO14229-1 (see [14])

Term	Description
OBD Service	This refers to an OBD Service as defined in ISO15031-5 (see [15])

### 2.2 Abbreviations

Abbreviation/	Description:
Acronym:	
API	Application Programming Interface
CAN	Controller Area Network
DCM	Diagnostic Communication Manager
DEM	Diagnostic Event Manager
DET	Development Error Tracer
DID	Data Identifier
DSD	Diagnostic Service Dispatcher (submodule of the DCM module)
DSL	Diagnostic Session Layer (submodule of the DCM module)
DSP	Diagnostic Service Processing (submodule of the DCM module)
DTC	Diagnostic Trouble Codes
ID	Identifier
LIN	Local Interconnect Network
MCU	Micro-Controller Unit
MOST	Media Orientated System Transport
NRC	Negative Response Code
OBD	On-Board Diagnosis
OSI	Open Systems Interconnection
PDU	Protocol Data Unit
PID	Parameter Identifier
ROE	ResponseOnEvent
RTE	Runtime Environment
SAP	Service Access Point
SDU	Service Data Unit
SID	Service Identifier
SW-C	Software-Component
TP	Transport Protocol
UDS	Unified Diagnostic Services
Xxx_	Placeholder for an API provider

# 2.3 Typographical Conventions

This document uses the following typographical conventions:

- See configuration parameter *myConfigurationParameter*: this is a reference to a configuration parameter which can be found in Chapter 10.
- myFunction(): this is a function provided or required by the module as defined in Chapter 8.

## 4 Constraints and assumptions

# 4.1 Applicability to car domains

The DCM module can be used for all car domains.

# 4.2 Applicability to emission-related environments (OBD)

This DCM SWS is intended to fulfill the emission related requirements given by legislator. However, the supplier of the emission related system is responsible to fulfill the OBD requirements.

Certain requirements cannot be fulfilled by the DCM module by itself, but need to be considered at the level of the entire ECU or system. Example: During the integration of the DCM module within the system, the timing requirements (50ms response time) must be fulfilled.

### Dependencies to other modules

The AUTOSAR Diagnostic Communication Manager (DCM) has interfaces and dependencies to the following Basic Software modules and SW-Cs:

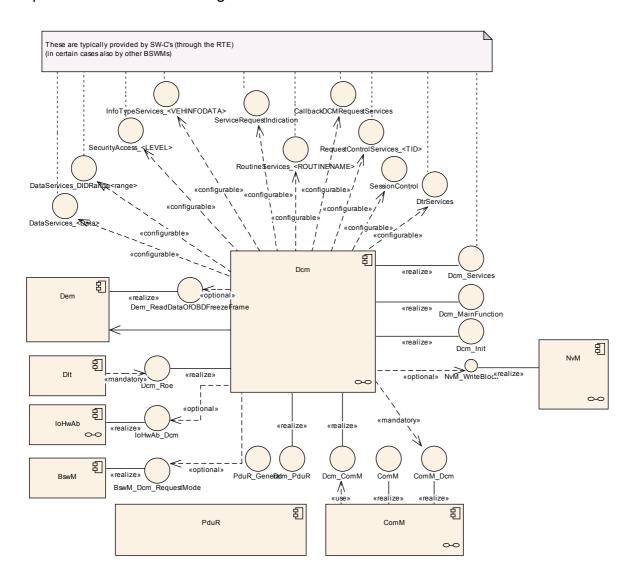

Figure 3 Interaction of the DCM with other modules

- Diagnostic Event Manager (DEM): The DEM module provides function to retrieve all information related to fault memory such that the DCM module is able to respond to tester requests by reading data from the fault memory.
- Protocol Data Unit Router (PduR module): The PduR module provides functions to transmit and receive diagnostic data. Proper operation of the DCM module presumes that the PduR interface supports all service primitives defined for the Service Access Point (SAP) between diagnostic application layer and underlying transport layer (see ISO14229-1 [14] chapter 5. Application layer services).
- Communication Manager (ComM): The ComM module provides functions

- such that the DCM module can indicate the states "active" and "inactive" for diagnostic communication. The DCM module provides functionality to handle communication requirements "Full-/ Silent-/ No-Communication". Additionally, the DCM module provides the functionality to enable and disable Diagnostic Communication if requested by the ComM module.
- SW-C and RTE: The DCM module has the capability to analyze the received diagnostic request data stream and handles all functionalities related to diagnostic communication such as protocol handling and timing. Based on the analysis of the request data stream the DCM module assembles the response data stream and delegates routines or IO-Control executions to SW-Cs . If any of the data elements or functional states cannot be provided by the DCM module itself the DCM requests data or functional states from SW-Cs via portinterfaces or from other BSW modules through direct function-calls.
- BswM: The BswM allows the DCM to request a mode change, e.g. in case of reset or session change

#### 5.1 File structure

#### 5.1.1 Code file structure

[Dcm054] The code file structure shall not be defined within the DCM SWS completely. At this point it shall be pointed out that the code-file structure shall include the following files named:

- If single pre-compile const parameter file is implemented: Dcm Cfg.c for pre-compile const parameter
- If multiple pre-compile const parameter file is implemented: Dcm</mplementation specific name> Cfg.c – for pre-compile const parameter
- If single link time configurable parameters file is implemented: Dcm Lcfq.c for link time configurable parameters
- If multiple link time configurable parameter file is implemented: Dcm</mplementation specific name> Lcfg.c – for link time configurable parameters
- If single post build time configurable parameters file is implemented: Dcm PBcfg.c – for post build time configurable parameters.
- If multiple post build time configurable parameter file is implemented: Dcm</mplementation specific name> PBcfg.c – for post build time configurable parameters

These files shall contain all link time and post-build time configurable parameters. | (BSW00380, BSW00419, BSW00346, BSW158, BSW00370, BSW00301)

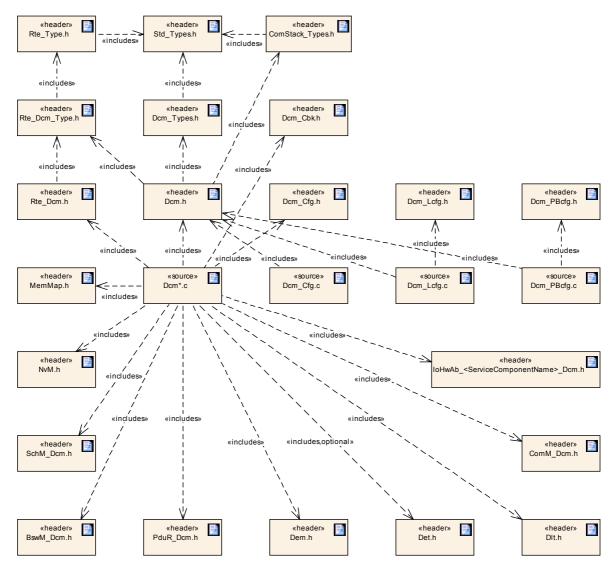

Figure 4: DCM module file structure

#### 5.1.2 Header file structure

[Dcm055] The DCM module shall use the header file structure shown in Figure 5 (BSW00381, BSW00412, BSW00435, BSW00436, BSW00302)

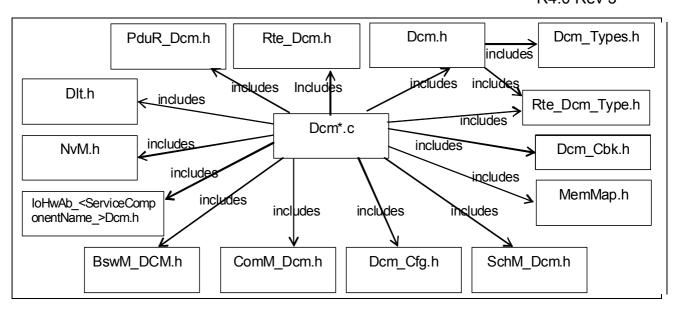

Figure 5: DCM module header file structure

[Dcm110] [ The file Dcm.h shall include the public interface of the DCM module. This file contains all types, functions and parameters that are visible to any SW-C. ()

[Dcm107] The implementation may be contained in one or multiple Dcm\*.c files. |()

[Dcm683] The file Dcm Types.h include all DCM type definition ()

[Dcm108] Any callbacks supplied by a SW-C shall be located in Rte Dcm.h. ()

**Dcm750** The file Dcm.h shall include Rte Dcm Type.h to include the types which are common used by BSW Modules and Software Components. This file shall only contain types, that are not already defined in Rte Dcm Type.h. |()

As shown in Figure 5 the DCM module header files are linked as followed:

[Dcm109] \( \text{Dcm.c shall include SchM Dcm.h.} \( \text{I} \)

[Dcm332] [ The DCM module shall include the file Dem.h. |()

[Dcm367] \( \text{The DCM module shall perform Inter Module Checks to avoid the } \) integration of incompatible files. The imported included files shall be checked by preprocessing directives.

The following version numbers shall be verified:

- <MODULENAME> AR RELEASE MAJOR VERSION
- <MODULENAME> AR RELEASE MINOR VERSION

If the values are not identical to the values expected, an error shall be reported. (BSW004)

### 5.1.3 Design Rules

[Dcm550] [ The DCM module's source (as long as it is written in C) shall conform to the HIS subset of the MISRA C Standard. () [Dcm551] [ The DCM module's source shall not use compiler and platform specific keywords (BSW00306)

[Dcm552] \( \text{The DCM module's source shall indicate all global data with read-only \) properties by explicitly assigning the keyword const. (BSW00309)

[Dcm553] [ The DCM module may use macros (instead of functions) where source code is used and runtime is critical. (BSW00330)

[Dcm554] [ The DCM module shall not define global data in header files (If global variables have to be used, the definition should take place in the C file) (BSW00308)

[Dcm555] The DCM module's source shall not be processor and compiler dependent.

(BSW006)

# 6.1 Document: General requirements on Basic Software modules:

Functional General Requirements	
Requirement	Satisfied by
Configuration	
[BSW00344] Reference to link-time configuration	Fulfilled by chapter 10
[BSW00404] Reference to post build time configuration	Fulfilled by chapter 10
[BSW00405] Reference to multiple configuration sets	Fulfilled by chapter 10
[BSW00345] Pre-compile-time configuration	Fulfilled by chapter 10
[BSW159] Tool-based configuration	Not applicable
	Requirement on configuration
[BSW167] Static configuration checking	tool
[BSW171] Configurability of optional functionality	Fulfilled by chapter 10
[BSW170] Data for reconfiguration of AUTOSAR SW-	
Components	Not applicable
[BSW00380] Separate C-Files for configuration parameters	<u>Dcm054</u>

[BSW00419] Separate C-Files for pre-compile time	
configuration parameters	<u>Dcm054</u>
[BSW00381] Separate configuration header file for pre-	
compile time parameters	<u>Dcm055</u>
[BSW00412] Separate H-File for configuration parameters	<u>Dcm055</u>
[BSW00383] List dependencies of configuration files	Not applicable
[BSW00384] List dependencies to other modules	Fulfilled by chapter 5
[BSW00387] Specify the configuration class of callback	
function	Not applicable
[BSW00388] Introduce containers	Fulfilled by chapter 10
[BSW00389] Containers shall have names	Fulfilled by chapter 10
[BSW00390] Parameter content shall be unique within the	
module	Fulfilled by chapter 10
[BSW00391] Parameter shall have unique names	Fulfilled by chapter 10
[BSW00392] Parameters shall have a type	Fulfilled by chapter 10
	Fulfilled by chapter 10.2 to
[BSW00393] Parameters shall have a range	10.5
[BSW00394] Specify the scope of the parameters	N/A
[BSW00395] List the required parameters (per parameter)	Fulfilled by chapter 10
[BSW00396] Configuration classes	Dcm171, Dcm172, Dcm173
[BSW00397] Pre-compile-time parameters	Fulfilled by chapter 10
[BSW00398] Link-time parameters	Fulfilled by chapter 10
[BSW00399] Loadable Post-build time parameters	Fulfilled by chapter 10
[BSW00400] Selectable Post-build time parameters	Fulfilled by chapter 10
[BSW00438] Post Build Configuration Data Structure	<u>Dcm037</u>
[BSW00402] Published information	Fulfilled by chapter 10
Wake-Up	
[BSW00375] Notification of wake-up reason	Not applicable
Initialization	
	<u>Dcm033</u> , <u>Dcm034</u> ; <u>Dcm035</u> ,
[BSW101] Initialization interface	Dcm036, Dcm037
[BSW00416] Sequence of Initialization	Not applicable
	1
[BSW00406] Check module initialization	Not applicable
[BSW00406] Check module initialization [BSW00437] NoInit–Area in RAM	Not applicable Not applicable
[BSW00406] Check module initialization [BSW00437] NoInit–Area in RAM Normal Operation	Not applicable
[BSW00406] Check module initialization [BSW00437] NoInit–Area in RAM Normal Operation [BSW168] Diagnostic Interface of SW components	Not applicable Not applicable
[BSW00406] Check module initialization [BSW00437] NoInit–Area in RAM Normal Operation [BSW168] Diagnostic Interface of SW components [BSW00407] Function to read out published parameters	Not applicable
[BSW00406] Check module initialization [BSW00437] NoInit–Area in RAM Normal Operation [BSW168] Diagnostic Interface of SW components [BSW00407] Function to read out published parameters [BSW00423] Usage of SW-C template to describe BSW	Not applicable Not applicable Dcm065
[BSW00406] Check module initialization [BSW00437] NoInit—Area in RAM Normal Operation [BSW168] Diagnostic Interface of SW components [BSW00407] Function to read out published parameters [BSW00423] Usage of SW-C template to describe BSW modules with AUTOSAR Interfaces	Not applicable Not applicable Dcm065 Not applicable
[BSW00406] Check module initialization [BSW00437] NoInit—Area in RAM Normal Operation [BSW168] Diagnostic Interface of SW components [BSW00407] Function to read out published parameters [BSW00423] Usage of SW-C template to describe BSW modules with AUTOSAR Interfaces [BSW00424] BSW main processing function task allocation	Not applicable Not applicable Dcm065  Not applicable Dcm053
[BSW00406] Check module initialization [BSW00437] NoInit–Area in RAM Normal Operation [BSW168] Diagnostic Interface of SW components [BSW00407] Function to read out published parameters [BSW00423] Usage of SW-C template to describe BSW modules with AUTOSAR Interfaces [BSW00424] BSW main processing function task allocation [BSW00425] Trigger conditions for schedulable objects	Not applicable Not applicable Dcm065  Not applicable Dcm053 Not applicable
[BSW00406] Check module initialization [BSW00437] NoInit–Area in RAM Normal Operation [BSW168] Diagnostic Interface of SW components [BSW00407] Function to read out published parameters [BSW00423] Usage of SW-C template to describe BSW modules with AUTOSAR Interfaces [BSW00424] BSW main processing function task allocation [BSW00425] Trigger conditions for schedulable objects [BSW00426] Exclusive areas in BSW modules	Not applicable  Not applicable  Dcm065  Not applicable  Dcm053  Not applicable  Not applicable  Not applicable
[BSW00406] Check module initialization [BSW00437] NoInit—Area in RAM Normal Operation [BSW168] Diagnostic Interface of SW components [BSW00407] Function to read out published parameters [BSW00423] Usage of SW-C template to describe BSW modules with AUTOSAR Interfaces [BSW00424] BSW main processing function task allocation [BSW00425] Trigger conditions for schedulable objects [BSW00426] Exclusive areas in BSW modules [BSW00427] ISR description for BSW modules	Not applicable Not applicable Dcm065  Not applicable Dcm053 Not applicable
[BSW00406] Check module initialization [BSW00437] NoInit–Area in RAM Normal Operation [BSW168] Diagnostic Interface of SW components [BSW00407] Function to read out published parameters [BSW00423] Usage of SW-C template to describe BSW modules with AUTOSAR Interfaces [BSW00424] BSW main processing function task allocation [BSW00425] Trigger conditions for schedulable objects [BSW00426] Exclusive areas in BSW modules [BSW00427] ISR description for BSW modules [BSW00428] Execution order dependencies of main	Not applicable Not applicable Dcm065  Not applicable Dcm053 Not applicable Not applicable Not applicable Not applicable
[BSW00406] Check module initialization [BSW00437] NoInit—Area in RAM  Normal Operation [BSW168] Diagnostic Interface of SW components [BSW00407] Function to read out published parameters [BSW00423] Usage of SW-C template to describe BSW modules with AUTOSAR Interfaces [BSW00424] BSW main processing function task allocation [BSW00425] Trigger conditions for schedulable objects [BSW00426] Exclusive areas in BSW modules [BSW00427] ISR description for BSW modules [BSW00428] Execution order dependencies of main processing functions	Not applicable  Not applicable  Dcm065  Not applicable  Dcm053  Not applicable  Not applicable  Not applicable  Not applicable  Not applicable  Not applicable
[BSW00406] Check module initialization [BSW00437] NoInit—Area in RAM Normal Operation [BSW168] Diagnostic Interface of SW components [BSW00407] Function to read out published parameters [BSW00423] Usage of SW-C template to describe BSW modules with AUTOSAR Interfaces [BSW00424] BSW main processing function task allocation [BSW00425] Trigger conditions for schedulable objects [BSW00426] Exclusive areas in BSW modules [BSW00427] ISR description for BSW modules [BSW00428] Execution order dependencies of main processing functions [BSW00429] Restricted BSW OS functionality access	Not applicable Not applicable Dcm065  Not applicable Dcm053 Not applicable Not applicable Not applicable Not applicable
[BSW00406] Check module initialization [BSW00437] NoInit—Area in RAM Normal Operation [BSW168] Diagnostic Interface of SW components [BSW00407] Function to read out published parameters [BSW00423] Usage of SW-C template to describe BSW modules with AUTOSAR Interfaces [BSW00424] BSW main processing function task allocation [BSW00425] Trigger conditions for schedulable objects [BSW00426] Exclusive areas in BSW modules [BSW00427] ISR description for BSW modules [BSW00428] Execution order dependencies of main processing functions [BSW00429] Restricted BSW OS functionality access [BSW00432] Modules should have separate main processing	Not applicable  Not applicable Dcm065  Not applicable Dcm053  Not applicable

# 7 Functional specification

# 7.1 General design elements

## 7.1.1 Submodules within the DCM module

To define the functionality of the DCM module, The DCM SWS models the DCM module as consisting of the following submodules:

- Diagnostic Session Layer (DSL) submodule: The DSL submodule ensures data flow concerning diagnostic requests and responses, supervises and guarantees diagnostic protocol timing and manages diagnostic states (especially diagnostic session and security).
- Diagnostic Service Dispatcher (DSD) submodule: The DSD submodule processes a stream of diagnostic data. The submodule:
  - Receives a new diagnostic request over a network and forwards it to a data processor.
  - Transmits a diagnostic response over a network when triggered by the data processor (e.g. by the DSP submodule).
- Diagnostic Service Processing (DSP) submodule: The DSP submodule handles the actual diagnostic service (respectively subservice) requests.

The next graphic gives an overview of the interfaces between the submodules DSP, DSD, and DSL within the DCM module.

R4.0 Rev 3

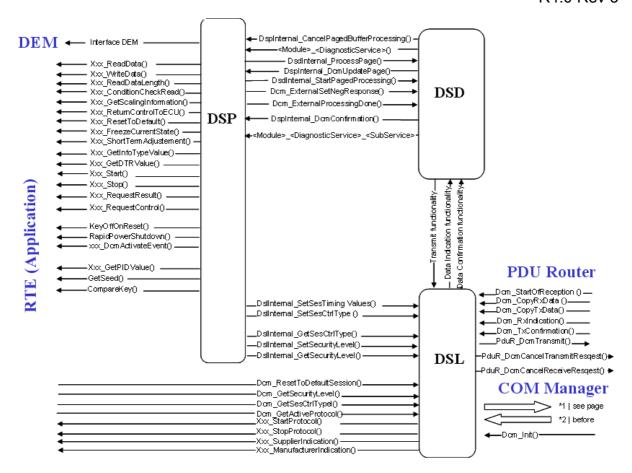

Figure 6 Possible interaction between the submodules in the DCM

Note: The implementation of these submodules and the interfaces between them is not mandatory. They are introduced only to improve the readability of the specification.

# 7.1.2 Negative Response Code (NRC)

The standards defining the UDS Services and OBD Services define the negative response codes (NRCs).

The DCM SWS uses these NRCs in the interfaces between the DCM and other BSW modules and the SW-Cs. These NRCs are defined in the data type Dcm NegativeResponseCodeType.

# 7.2 Diagnostic Session Layer (DSL)

## 7.2.1 Introduction

[Dcm030] [ All functional areas of the DSL submodule shall be in conformance with the specifications ISO14229-1 [14] and the network-independent part of ISO15765-3 [17]. (BSW04003)

There is no network-dependent functional area in the DSL submodule. Within the configuration, some parameters can be set dependent on the network.

## 7.2.2 Use cases

The DSL submodule provides the following functionalities:

- Session handling (as required by ISO14229-1 [14] and ISO 15765-3 [17]).
- Application layer timing handling (as required by ISO14229-1 [14] and ISO 15765-3 [17]),
- Specific response behavior (as required by ISO14229-1 [14] and ISO 15765-3 [17]).

## 7.2.3 Interaction with other modules

The DSL has the following interaction with other modules:

- PduR module
  - O PduR module provides data of incoming diagnostic requests.
  - The DSL submodule triggers output of diagnostic responses.
- DSD submodule
  - The DSL submodule informs the DSD submodule about incoming requests and provides the data.
  - The DSD submodule triggers output of diagnostic responses.
- SW-Cs / DSP submodule. The DSL submodule provides access to security and session state.
- ComM module
  - O The DSL submodule guarantees the communication behavior required by the ComM module

## 7.2.4 Functional description

### **7.2.4.1 Overview**

The DSL submodule provides the following functionality:

## Request Handling

- Forward requests from the PduR module to the DSD submodule.
- Concurrent "TesterPresent" ("keep alive logic").

## Response Handling

- Forward responses from the DSD submodule to the PduR module.
- Guarantee response timing to tester.
- Support of periodic transmission.
- Support of ResponseOnEvent (ROE) transmission.
- Support of segmented response.
- Support of ResponsePending response triggered by the application.

## Security Level Handling

- Manage security level.

## Session State Handling

- Manage session state.
- Keep track of active non-default sessions.
- Allows modifying timings.

## Diagnostic Protocol Handling

- Handling of different diagnostic protocols.
- Manage resources.

## Communication Mode Handling

- Handling of communication requirements (Full- / Silent- / No Communication).
- Indicating of active / inactive diagnostic.
- Enabling / disabling all kinds of diagnostic transmissions.

## 7.2.4.2 Forward requests from the PduR module to the DSD submodule

The PduR module indicates the DCM module whenever a reception of new diagnostic request content is started on a DcmRxPduld, which is assigned to the DCM module. This is done by calling Dcm StartOfReception(), which inform the DCM module of the data size to be received and allows the DCM to reject the reception if the data size overflow its buffer size. The further call to Dcm CopyRxData request the DCM module to copy the data from the provided buffer to the DCM buffer.

If the reception of a diagnostic request is finished (successful or with errors) the PduR module will call Dcm TpRxIndication() to give a receive indication to the DCM module.

[Dcm111] The DSL submodule shall forward received data to the DSD submodule only after a call of Dcm TpRxIndication() with parameter Result = NTFRSLT OK (see <u>Dcm093</u>). <sub>|</sub>()

[Dcm241] \( \text{As soon as a request message is received (after a call of Dcm TpRxIndication() with parameter Result = NTFRSLT OK (see <a href="Dcm093">Dcm093</a>) and until a call to Dcm TpTxConfirmation() (see Dcm351) for the associated Tx-DcmPduld), the DSL submodule shall block the corresponding DcmPduld. During the processing of this request, no other request of the same protocol type (e.g. an enhanced session can be ended by a OBD session) can be received, until the corresponding response message is sent and the DcmPduld is released again. ()

More descriptions of the APIs (prototype, input/output parameter) can be found in the interface description of PduR module (see [2]).

It is allowed to have different DcmPdulds for different diagnostic communication applications. For example:

- OBD DcmRxPduld: for reception of OBD requests,
- OBD DcmTxPduld: for transmission of OBD responses,
- UDS phys DcmRxPduld: for reception of UDS physically addressed requests,
- UDS func DcmRxPduld: for reception of UDS functionally addressed requests,
- UDS DcmTxPduld: for transmission of UDS responses.

Address type (physical/functional addressing) is configured per DcmRxPduld (see configuration parameter **DcmDsIProtocolRx**). A configuration per DcmRxPduId is possible because there will always be different DcmRxPduId values for functional and physical receptions, independent of the addressing format of the Transport Layer (extended addressing, normal addressing).

## 7.2.4.3 Concurrent "TesterPresent" ("keep alive logic")

It is possible, that functional "TesterPresent" commands are sent by the tester in parallel to physical requests/responses. This is called "keep alive logic" in ISO14229-1 [14]. This functional "TesterPresent" will be received on a separate DcmRxPduld (UDS func DcmRxPduld) with a separate receive buffer. Due to that reason, the functional TesterPresent (and only functional TesterPresent without response) is handled in the following way:

[Dcm112] [ When the PduR module calls Dcm TpRxIndication() with parameter Result=NTFRSLT OK (see Dcm093) and if the request is a "TesterPresent" command with "suppressPosRspMsgIndicationBit" set to TRUE (SID equal to 0x3E, subfunction equal to 0x80), the DSL submodule shall reset the session timeout timer (S3Server). ()

[Dcm113] [ When the PduR module calls Dcm TpRxIndication() with parameter Result = NTFRSLT OK (see Dcm093) and if the request is a "TesterPresent" command with "suppressPosRspMsgIndicationBit" set to TRUE (SID equal to 0x3E, subfunction equal to 0x80), the DSL submodule shall not forward this request to the DSD submodule for further interpretation. ()

Rationale for Dcm113: Because of bypassing the functional "TesterPresent" in the DSL submodule, the DCM module is able to receive and process next physical requests without any delay.

## 7.2.4.4 Forward responses from the DSD submodule to the PduR module

[Dcm114] The DSD submodule shall request the DSL submodule for transmission of responses. ()

[Dcm115] \( \text{ When the diagnostic response is ready the DSL submodule shall trigger \) the transmission of the diagnostic response to the PduR module by calling PduR DcmTransmit(). ()

Responses are sent with the DcmTxPduId, which is linked in the DCM module configuration to the DcmRxPduId, i.e. the ID the request was received with (see configuration parameter **DcmDsIProtocolTx**)

Within PduR DcmTransmit() only the length information is given to the PduR module. After the DCM module has called PduR DcmTransmit(), the PduR module will call Dcm CopyTxData() to request the DCM module to provide the data to be transmitted and will call Dcm TpTxConfirmation() after the complete PDU has successfully been transmitted or an error occurred.

[Dcm117] [ If the DSL submodule receives a confirmation after the complete DCM PDU has successfully been transmitted or an error occurred by a call of Dcm TpTxConfirmation(), then the DSL submodule shall forward this confirmation to the DSD submodule. ()

[Dcm118] [ In case of a failed transmission (failed PduR DcmTransmit() request) or error confirmation (Dcm TpTxConfirmation() with error), the DSD submodule shall not repeat the diagnostic response transmission. ()

More descriptions of the APIs (prototype, input/output parameter) can be found in the interface description of the PduR module (see [2]).

## 7.2.4.5 Guarantee timing to tester by sending busy responses

[Dcm024] [ If the Application (or the DSP submodule) is able to perform a requested diagnostic task, but needs additional time to finish the task and prepare the response, then the DSL submodule shall send a negative response with NRC 0x78 (Response pending) when reaching the response time (DcmTimStrP2ServerAdjust respectively DcmTimStrP2StarServerAdjust). (BSW04016)

Rationale for Dcm024: The DSL submodule guarantees the response timing to tester.

[Dcm119] The DSL submodule shall send negative responses as required in Dcm024 from a separate buffer. ()

Rationale for Dcm119: This is needed in order to avoid overwriting the ongoing processing of requests, e.g. the application already prepared response contents in the diagnostic buffer.

The number of negative responses with NRC 0x78 (Response pending) for one diagnostic request is limited by the configuration parameter **DcmDsIDiagRespMaxNumRespPend**. This avoids deadlocks in the Application.

[Dcm120] [ If the number of negative responses for a requested diagnostic tasks (see Dcm024) reaches the value defined in the configuration parameter **DcmDsIDiagRespMaxNumRespPend**, the DCM module shall stop processing the active diagnostic request, inform the application or BSW (if this diagnostic task implies the call to a SW-C interface or a BSW interface) by setting OpStatus parameter, of active port interface, to DCM CANCEL and shall send a negative response with NRC 0x10 (General reject). ()

## 7.2.4.6 Support of periodic transmission

The UDS service ReadDataByPeriodicIdentifier (0x2A) allows the tester to request the periodic transmission of data record values from the ECU identified by one or more periodicDataIdentifiers.

TYPE1 = messages on the DcmTxPduId already used for normal diagnostic responses.

**[Dcm121]** [ If a pending message for normal diagnostic responses (higher priority) exists, then the DSL submodule shall wait for the transmission confirmation (Call to Dcm TpTxConfirmation()) for this normal diagnostic response before sending the periodic transmission message. ()

TYPE2 = messages on a separate DcmTxPduId.

This type of information can be configured in *DcmDslProtocolTransType*.

TYPE2, the separate DcmPduld configured case of can be DcmDsIPeriodicTxPduRef

[Dcm122] [ The DCM module shall send responses for periodic transmissions using a separate protocol and a separate buffer of configurable size. ()

The **DcmDsIPeriodicTranmissionConRef** configuration parameter allows linking the protocol used to receive the periodic transmission request / transmit the periodic transmission response to the protocol used for the transmission of the periodic transmission messages. Note that multiple DcmTxPdulds can be assigned to the periodic transmission protocol.

The DCM module respects several restrictions according to the communication mode:

[Dcm123] [Periodic transmission communication shall only take place in Full Communication Mode. ()

Periodic transmission events can occur when not in Full Communication Mode. So the following requirement exists:

[Dcm125] The DCM module shall discard periodic transmission events beside Full Communication Mode and shall not queue it for transmission. ()

[Dcm126] [ Periodic transmission events shall not activate the Full Communication Mode. ()

## 7.2.4.7 Support of ROE transmission

With the UDS Service ResponseOnEvent (0x86), a tester requests an ECU to start or stop transmission of responses initiated by a specified event. Upon registering an event for transmission, the tester also specifies the corresponding service to respond to (e.g. UDS Service ReadDataByldentifier (0x22)).

[Dcm595] The ROE functionality is enabled only if the container DcmDslResponseOnEvent exists ()

**[Dcm597]** ☐ If the configuration parameter *DcmDspRoeInitOnDSC* is set to TRUE: on reception of service DiagnosticSessionControl, if ROE is active (reception of startResponseOnEvent) the DCM module shall unactivate all ROE active event. For OnChangeOfDataIdentifier events configured as externally managed (presence of a DcmDspDidExtRoe container in the associated DcmDspDid container), the DCM shall call the configured Api or RTE operation xxx ActivateEvent (see DcmDspDidRoeActivateFnc) with state value DCM ROE UNACTIVE and the configured RoeEventId (see DcmDspDidRoeEventId) ()

[Dcm618] [ If the configuration parameter DcmDspRoeInitOnDSC is set to TRUE: on S3Server timeout, if ROE is active (reception of startResponseOnEvent) the DCM module shall unactivate all ROE active event. For OnChangeOfDataIdentifier events configured as externally managed (presence of a DcmDspDidExtRoe container in the associated DcmDspDid container), the DCM shall call the configured Api or RTE operation xxx ActivateEvent (see DcmDspDidRoeActivateFnc) with state value DCM ROE UNACTIVE and the configured RoeEventId (see DcmDspDidRoeEventId) ()

[Dcm709] The DCM shall implement the parameter storageState (Bit 6 of the eventType sub-function) which indicates whether the event shall be stored in nonvolatile memory in the server and re-activated upon the next power-up of the server or if it shall terminate once the server powers down. ()

[Dcm711] The DCM shall implement the parameter *EventWindowTime* used to specify a window for the event logic to be active in the server. ()

**Dcm747** If the parameter value of *EventWindowTime* is set to 0x02 then the response time is infinite. If the parameter value is different from 0x02, then this parameter is vehicleManufacturerSpecific. ()

**Dcm748** If *EventWindowTime* parameter is vehicleManufacturerSpecific, the DCM shall call the configured Api XXX ROEInit(EventWindowTime) (see configuration parameter DcmDspRoeInitFnc) to initialize the SWC/integration code. Dcm StopROE() shall be called to stop the ROE event if the EventWindowTime timed out (see [Dcm713). Dcm RestartROE() shall be called if the ROE needs to be restarted after a PowerDownReset (see [Dcm714). ()

**[Dcm712]** \( \text{ If the ROE is stopped by a diagnostic request, the \( \text{EventWindowTime} \) needs to be stopped by calling the configured function XXX\_ROEStop().(see configuration parameter DcmDspRoeStopFnc) //

[Dcm713] \( \text{On } Dcm \) StopROE() call, the DCM shall clear the ROE event from the transmission queue. ()

[Dcm714] \( \text{On Dcm RestartROE()} \) call, the DCM shall restart the ROE event. \( \text{()} \)

## 7.2.4.7.1 TYPE1 = Responses are sent on the same DcmTxPduId that was used for the ROE service response.

[Dcm127] [ If the UDS service ResponseOnEvent (0x86) is received, then the DSP submodule shall store the DcmRxPduld, which is provided in the pMsgContext parameter of the ROE service function. ()

[Dcm128] The DSP submodule shall forward this stored DcmRxPduld as parameter in the DslInternal ResponseOnOneEvent() function, where it is used to simulate a request. ()

**[Dcm129]** [ If a pending message for normal diagnostic responses (higher priority) exists, then the DSL submodule shall wait for the transmission confirmation (Call to Dcm TpTxConfirmation()) for this normal diagnostic response before sending the event-triggered responses. ()

## 7.2.4.7.2 TYPE2 = Responses are sent on a separate DcmTxPduld.

This type of information can be configured in *DcmDsIProtocolTransType*. In case of TYPE2, the separate channel can be configured in *DcmDsIRoeTxPduRef* Responses generated by UDS Service ResponseOnEvent (0x86) use a separate protocol and so a separate buffer of configurable size.

[Dcm131] The configured protocol buffer shall be used for transmission of the ROE messages (as the reception shall use a separate protocol, a separate buffer needs to be used for reception). ()

[Dcm132] The content of the pMsgContext pointer (ROE message) shall be copied into the buffer. ()

Configuration parameter **DcmDsIROEConnectionRef** allows linking the protocol used to receive the ROE request / transmit the ROE response to the protocol used for the ROE event messages.

[Dcm133] [ ROE communication shall only be performed in Full Communication Mode. ()

[Dcm134] [ROE events shall be disabled in any other Communication Mode except for the Full Communication Mode. ()

[Dcm135] \( \text{ROE} \) events beside Full Communication Mode shall be discarded and not gueued for later transmission. If the storageState parameter is enabled (see [Dcm709), the ROE event shall be reactivated upon the next power-up of the server only after the Full Communication Mode activation. ()

[Dcm136] ROE events requested by the Application shall not activate the Full Communication Mode. ()

[Dcm558] [ If an ROE event occurs and the serviceToRespondTo is already in execution and is not re-entrant (e.g ReadDTCInformation), the DCM shall delay the event until the current request is finished. ()

## 7.2.4.7.3 Please note the following limitations:

[Dcm137] \( \text{ While processing an ROE TYPE1 event, any additional requests} \) (external and internal) shall be rejected with the same or lower priority of its Protocol Table. ()

This limitation doesn't apply to ROE TYPE2 event.

## 7.2.4.7.4 **OnTimerInterrupt**

If the resolution of the Main function is sufficient, it can be implemented inside the DCM, in other case it would be a limitation of the DCM and the subservice OnTimerInterrupt would not be supported.

## 7.2.4.7.5 OnChangeOfDataldentifier

The subservice OnChangeOfDataIdentifier can be fully implemented inside the DCM or partially outside.

In the first case, the DCM will poll periodically the DID value to compare it. In the second case the DCM will activate the event in the module implementing this ROE event and wait a trigger of this module to execute the ROE response. It will be, e.g., the case of the DLT module.

[Dcm522] The DCM shall implement the subservice

OnChangeOfDataIdentifier (BSW04100)

[Dcm523] [ If at least one ROE DID is configured as internally managed, the DCM shall provide a temporary buffer to store the DID value during the execution of a ROE process for subservice OnChangeOfDataIdentifier. The parameter DcmDspRoeBufSize is used to define the size of this buffer. (BSW04100)

Note: This buffer is used only in the case a ROE DID is managed internally. If all ROE DID are managed externally, this buffer is not required.

**[Dcm524]** \( \text{On reception of the subservice startResponseOnEvent, if the event has been set up (reception of ROE request with EventType equal to OnChangeOfDataIdentifier) and is configured as internally managed (absence of DcmDspDidExtRoe container in the associated DcmDspDid container), the DCM shall poll periodically (MainFunction period) the associated DID value and compare it to the previous value. If the value has changed the DCM shall execute the associated service. (The response message is transmitted directly or added in the ROE gueue if configured) (BSW04100)

**[Dcm525]** \( \text{On reception of the subservice startResponseOnEvent, if the event has been set up (reception of ROE request with EventType equal to OnChangeOfDataIdentifier) and is configured as externally managed (presence of a DcmDspDidExtRoe container in the associated DcmDspDid container), the DCM shall call the configured Api or RTE operation xxx ActivateEvent (see DcmDspDidRoeActivateFnc) with state value DCM ROE ACTIVE and the configured RoeEventId (see DcmDspDidRoeEventId) (BSW04100)

**[Dcm526]** On reception of the subservice stopResponseOnEvent, if the event has been set up (reception of ROE request with EventType equal to OnChangeOfDataIdentifier) and is configured as externally managed (presence of a DcmDspDidExtRoe container in the associated DcmDspDid container), the DCM shall call the configured Api or RTE operation xxx ActivateEvent (see DcmDspDidRoeActivateFnc) with state value DCM ROE UNACTIVE and the configured RoeEventId (see DcmDspDidRoeEventId) (BSW04100)

[Dcm582] [ The DCM shall process external ROE event only if no external diagnostic request is in process. If the event cannot be processed, the value E NOT OK shall be returned on call of Dcm TriggerOnEvent(). (BSW04100)

## Interaction with DLT:

For interaction with DLT module, the DCM shall be configured as follow:

- A DID with one data shall be configured for DLT purpose
- The data used for DLT purpose shall be set as available trough C function call (DcmDspDataUsePort=USE DATA SYNCH FNC or USE DATA ASYNCH FNC )
- DcmDspDataReadFnc of DLT data shall be set with the name of the DLT Api : Dlt ReadData
- DcmDspDataReadDataLengthFnc of DLT data shall be set with the name of the DLT Api : Dlt ReadDataLength
- DcmDspDidRoeActivateFnc of DLT DID shall be set with the name of the DLT Api : DIt ActivateEvent

## 7.2.4.7.6 OnDTCStatusChange

[Dcm598] The DCM shall implement the subservice OnDTCStatusChange ()

**[Dcm599]** On reception of the subservice startResponseOnEvent, if the event has been set up (reception of ROE request with EventType equal to OnDTCStatusChange), the DCM shall activate the DTC status change supervision. ]()

[Dcm600] \( \text{On reception of the subservice stopResponseOnEvent, if the event has} \) been set up (reception of ROE request with EventType equal to OnDTCStatusChange), the DCM shall unactivate the DTC status change supervision ()

[Dcm602] \( \text{On call to Dcm DemTriggerOnDTCStatus()} \) by DEM, the DCM shall check if the bits that have changed of state, correspond to the status mask provided in the the ROE request (with EventType equal to OnDTCStatusChange). If positive case, the DCM shall execute the associated service (The response message is transmitted directly or added in the ROE queue if enabled) ()

To prevent the network from being flooted with Roe-Messages when the fault memory provided by the DEM module is cleared by an external test tool, the DCM module suppresses the ROE messages of OnDtcStatusChange:

[Dcm603] [ If the DCM module is requested by an external tester to clear all DTCs, the DCM module shall not send ROE message triggered by OnDtcStatusChange during the clearing. ()

## 7.2.4.7.7 Roe transmission queue

The transmission gueue of ROE messages is needed, if the DCM module cannot send out the message at the point in time when it was triggered (e.g. high bus-load on CAN). Therefore the DCM module provides a mechanism to shift the message transmission to a later point in time.

[Dcm604] [ If the ROE functionality is enabled (See Dcm595), the DCM module shall provide a ROE transmission gueue depending of value of configuration parameter DcmDspRoeQueueEnabled ()

Note: The provided transmission queue is used for all ROE events (e.g. OnDtcStatusChanged, OnChangeOfDataIdentifier, ...).

[Dcm605] \[ \text{Due to limitation of resources the buffer for one ROE message is limited.} \] (refer to configuration Parameter DcmDspRoeMaxEventLength). ()

Note: If an ROE message on CAN consists of only one CAN frame (the parameter DcmRoeMaxEventLength is set to 8 byte), a flow control message is not needed.

[Dcm710] [ If the transmission queue of ROE messages is full, the Dcm shall drop the oldest event from the queue to make space for the new event. ()

[Dcm606] [ If the ROE queue mechanism is disabled for an event(see configuration parameter DcmDspDidRoeQueueEnabled), if the event occurs the response message is sended only if no transmission is in progress. The ROE queue mechanism can only be disabled event per event for subservice OnChangeOfDataIdendifier ]()

Note: There may some DIDs which will need a large message and therefore the queuing mechanism cannot be supported.

[Dcm607] The ROE transmission queue of the DCM module shall implement the First-In-First-Out principle implying that the element which was put first in the queue will be transmitted first. ()

[Dcm608] The DCM module provides the configuration parameter DcmDspRoeMaxQueueLength defining the maximum number of queued messages. ()

Note: The defined length of one ROE message (refer to DcmRoeMaxEventLength) and the number of queued messages (refer to DcmDspRoeMaxQueueLength) defines the maximum memory resources, which have to be allocated/provided by the DCM module for the ROE transmission queue

[Dcm609] The DCM module shall provide a retry-mechanism of a ROE-Message to send out the message at a later point in time. ()

[Dcm610] The DCM module shall stop to retry the transmission of an ROE event after a configured number of time. (see configuration parameter DcmDspRoeMaxNumberOfRetry) ()

Note: if DcmDspRoeMaxNumberOfRetry is set to 0 no retry mechanism will be managed

[Dcm611] [ If the maximum number of retries is reached (refer to DcmDspRoeMaxNumberOfRetry), the DCM module shall remove the specific event from ROE queue. ()

Note: If the first gueued event of the ROE gueue was removed, the DCM module continues the transmission with the next event (refer to First-In-First-Out principle).

[Dcm612] \( \text{On reception of the subservice stopResponseOnEvent, the DCM shall} \) clear the ROE transmission queue ()

**[Dcm613]** ☐ If the configuration parameter *DcmDspRoeInitOnDSC* is set to TRUE: on reception of service DiagnosticSessionControl, if ROE is active (reception of startResponseOnEvent), the DCM shall clear the ROE transmission gueue. ()

**[Dcm619]** \( \text{If the configuration parameter } \( DcmDspRoeInitOnDSC \) is set to TRUE: on S3Server timeout, if ROE is active (reception of startResponseOnEvent), the DCM shall clear the ROE transmission queue. ()

## 7.2.4.7.8 Roe transmission cycle

[Dcm601] [ The DCM module shall respect a minimum time between two (2) consecutive Roe transmissions (see configuration parameter DcmDspRoeInterMessageTime) ()

Note: The inter message time is referred to a sending cycle. The configuration parameter DcmDspRoeInterMessageTime is used for the delay between two different consecutive Roe transmission and between two transmission of the retry mechanism.

## 7.2.4.8 Support of segmented response (paged-buffer)

[Dcm028] [ If enabled (DcmPagedBufferEnabled=TRUE), the DCM module shall provide a mechanism to send responses larger than the configured and allocated diagnostic buffer. (BSW04017)

With paged-buffer handling the ECU is not forced to provide a buffer, which is as large as the maximum length of response. Please note:

- paged-buffer handling is for transmit only no support for reception.
- paged-buffer handling is not available for the Application (DCM-internal use only).

## 7.2.4.9 Support of ResponsePending response triggered by the Application

In some cases, e.g. in case of routine execution, the Application needs to request an immediate NRC 0x78 (Response pending), which shall be sent immediately and not just before reaching the response time (P2ServerMax respectively P2\*ServerMax).

When the DCM module calls an operation and gets an error status E FORCE RCRRP, the DSL submodule will trigger the transmission of a negative response with NRC 0x78 (Response pending).

This response needs to be sent from a separate buffer, in order to avoid overwriting the ongoing processing of the request.

#### Manage security level 7.2.4.10

[Dcm020] The DSL submodule shall save the level of the current active security level. (BSW04005)

For accessing this level, the DSL submodule provides interfaces to:

- get the current active security level: Dcm GetSecurityLevel()
- set a new security level: DslInternal SetSecurityLevel()

[Dcm033] \[ During DCM initialization the security level is set to the value 0x00. (BSW101)

By Dcm033, the ECU is locked.

[Dcm139] The DSL shall reset the security level to the value 0x00 (i.e. the security is enabled) under one of the following conditions:

- if a transition from any diagnostic session other than the defaultSession to another session other than the defaultSession (including the currently active diagnostic session) is performed or
- if a transition from any diagnostic session other than the defaultSession to the defaultSession (DslInternal SetSecurityLevel()) (initiated by UDS Service DiagnosticSessionControl (0x10) or S3Server timeout) is performed. (1)

Only one security level can be active at a time.

#### 7.2.4.11 Manage session state

[Dcm022] The DSL submodule shall save the state of the current active session. (BSW04006)

For accessing this variable, the DSL submodule provides interfaces to:

• get the current active session: Dcm GetSesCtrlType()

• set a new session: DslInternal SetSesCtrlType()

[Dcm034] \[ During DCM initialization, the session state is set to the value 0x01 ("DefaultSession"). (BSW101)

#### 7.2.4.12 Keep track of active non-default sessions

Dcm140 [Whenever a non-default session is active and when the session timeout (S3Server) is reached without receiving any diagnostic request, the DSL submodule shall reset to the default session state ("DefaultSession", 0x01) and invoke the the mode switch of the ModeDeclarationGroupPrototype DcmDiagnosticSessionControl by calling

SchM Switch Dcm <vendorApiInfix> DcmDiagnosticSessionControl(SchM MODE DcmDiagnosticSessionControl DcmConf DcmDspSessionRow DEFAULT SESSION). ()

According to following table, the start / stop of S3Server timeout timer is processed:

## Dcm141 [

Sub- sequent start	Completion of any final response message or an error indication (Dcm_TpTxConfirmation(): confirmation of complete PDU or indication of an error)
	Completion of the requested action in case no response message (positive and negative) is required / allowed.
	Indicates an error during the reception of a multi-frame request message.  (Dcm TpRxIndication(): indication of an error)
Sub- sequent stop	Start of a multi-frame request message (Dcm_StartOfReception(): indicates start of PDU reception)
	Reception of single-frame request message.  (Dcm_StartOfReception(): indicates start of PDU reception)

<sup>&</sup>quot;Start of S3Server" means reset the timer and start counting from the beginning. ()

#### 7.2.4.13 Allow to modify timings

**Dcm027** The DCM module shall handle the following protocol timing parameters in compliance with [17]: P2ServerMin, P2ServerMax, P2\*ServerMin, P2\*ServerMax, S3Server (BSW04015)

Dcm143 □ P2min / P2\*min and S3Server shall be set to defined values: P2min = 0ms, P2\*min = 0ms, S3Server = 5s. (BSW04015)

Every protocol (OBD, enhanced diagnosis) have their own protocol timing values (given by default session configuration). These timing values are set when the protocol is started.

These protocol timing parameters have influence on the session layer timing (no influence on Transport Layer timing). Some of these timing parameters can be modified while protocol is active with the following means:

- UDS Service DiagnosticSessionControl (0x10)
- UDS Service AccessTimingParameter (0x83)

The DSL submodule provides the following functionalities to modify the timing parameters:

- Provide the active timing parameters,
- Set the new timing parameters. Activation of new timing values is only allowed after sending the response.

#### 7.2.4.14 Handling of different diagnostic protocols

It is necessary to distinguish between different diagnostic protocols (e.g. OBD, enhanced diagnosis ...).

Dcm018 ☐ Different protocols shall be used for UDS Services versus OBD Services ()

Dcm018 is required because of

- different protocol settings
- different valid service tables
- prioritization of protocols
- preemption of protocols

### 7.2.4.14.1 Different service tables

For the different protocols a different set of allowed diagnostic services is valid (e.g. the UDS commands for the enhanced diagnosis, the OBD mode services for the OBD protocol). It is possible to create different service tables and link them to the diagnostic protocol.

Dcm035 With every protocol initialization, the DSL submodule sets a link to the corresponding service table (see configuration parameter

DcmDslProtocolSlDTable). (BSW101)

The DSD submodule uses this link for further processing of diagnostic requests.

## 7.2.4.14.2 Prioritization of protocol

The configuration parameter **DcmDsIProtocolPriority** makes it possible to give each protocol its own relative priority.

Possible use case: There are ECUs, communicating with a vehicle-internal diagnostic tester (running on enhanced diagnosis) and a vehicle-external OBD tester. The OBD communication must have a higher priority than the enhanced diagnosis.

**Dcm015** \( \text{A protocol with higher priority is allowed to preempt the already running protocol. (BSW04021)

Differentiation of diagnostic protocols is possible, because of different DcmRxPduId (configured per protocol, see configuration parameter **DcmDsIProtocolRxPduRef**) referenced in the protocol configuration.

## 7.2.4.14.3 Preemption of protocol

**Dcm459** If a running diagnostic request is preempted by a higher prior request (of another protocol), the DSL submodule shall call all configured Xxx StopProtocol() functions (see configuration parameter

DcmDslCallbackDCMRequestService). |()

**Dcm079** In order to cancel pending transmission in lower-layer, related to the lower prior request, the DCM module shall call PduR DcmCancelTransmit () with the following parameters:

Pduld: the id of the Pdu to be canceled ()

Dcm460 | When PduR DcmCancelTransmit () returns E NOT OK, the DCM module shall assume that the ongoing transmission cannot be cancelled and shall not retry to cancel the transmit request. The current protocol shall be stopped and the new one started. ()

The PduR later calls Dcm TpTxConfirmation() to confirm the cancellation.

Dcm461 \( \text{When Dcm TpTxConfirmation () is called with } \)

NTFRSLT E CANCELATION NOT OK (meaning that an error occurred during the cancellation), the DCM module shall assume that the ongoing transmission cannot be cancelled and shall not retry to cancel the transmit request because this transmission has been confirmed. The current protocol shall be stopped and the new one started. ()

**Dcm559** ☐ If a running diagnostic request is preempted by a higher prior request (of another protocol), the DCM shall cancel all pending operation related to this request: for DEM operation: call of Dem DcmCancelOperation(), for external operation call the pending operation with Dcm OpStatus set to DCM CANCEL. ()

**Dcm575** ☐ In order to cancel pending reception in lower-layer, related to the lower prior request, the DCM module shall call PduR DcmCancelReceive () with the following parameters:

Pduld: the id of the Pdu to be canceled ()

Dcm576 \( \text{When PduR DcmCancelReceive () returns E NOT OK, the DCM } \) module shall assume that the ongoing reception cannot be cancelled and shall not retry to cancel the receiverequest. The current protocol shall be stopped and the new one started. ()

The PduR later calls Dcm TpRxIndication() to confirm the cancellation.

Dcm577 [ When Dcm TpRxIndication () is called with

NTFRSLT E CANCELATION NOT OK (meaning that an error occurred during the cancellation), the DCM module shall assume that the ongoing reception cannot be cancelled and shall not retry to cancel the receive request because this reception has been indicated. The current protocol shall be stopped and the new one started. (1)

**Dcm625** A Low-priority or same-priority request can preempt a higher priority protocol if this higher priority protocol is in default session and no active request is in execution phase. In this case the DSL submodule shall call all configured Xxx StopProtocol() functions (see configuration parameter

DcmDslCallbackDCMRequestService). |()

**Dcm728**: The handling of protocols with equal priority shall be possible.

**Dcm727** If a diagnostic request is already running and a second request (ClientB) can not be processed (e.g.due to priority assessment), the response behaviour depends on the configuration option parameter

DcmDsIDiagRespOnSecondDeclinedRequest (see Dcm914 Conf). If this configuration parameter is TRUE, a negative response with NRC 0x21 (BusyRepeatRequest) shall be issued for the second request (see Dcm788 and Dcm789). If the configuration parameter is FALSE, no response shall be issued (see Dcm790). ()

[Dcm729] In case of multiple clients with different PduIDs which are requesting the same protocol, as all the connections of the same protocol are having the same priority, a second request (with the different RxPduld) will not be processed. If the configuration parameter **DcmDsIDiagRespOnSecondDeclinedRequest** is TRUE, a negative response with NRC 0x21 (BusyRepeatRequest) shall be issued for the second request. If the configuration parameter is FALSE, no response shall be issued. ()

## 7.2.4.14.4 Detection of protocol start

[Dcm036] \( \text{ With first request of a diagnostic protocol, the DSL submodule shall call } \) all configured Xxx StartProtocol() functions (see configuration parameter DcmDslCallbackDCMRequestService). (BSW101)

Inside this function, the Application can examine the environment conditions and enable/disable further processing of the protocol.

[Dcm144] [ After all XXX StartProtocol() functions have returned E OK (meaning all components have allowed the start of the protocol), the default timing parameters are loaded from the default session configuration (see configuration parameter *DcmDspSessionRow*). The DcmDspSession table used is the one linked to the started protocol (see configuration parameter

DcmDslProtocolSessionRef) (BSW04015)

[Dcm145] [ After all XXX StartProtocol () functions have returned E OK (meaning all components have allowed the start of the protocol), the service table is set (see configuration parameter **DcmDsIProtocolSIDTable**). ()

[Dcm146] [ After all Xxx StartProtocol() functions have returned E OK (meaning all components have allowed the start of the protocol), the security state is reset. ()

[Dcm147] [ After all Xxx StartProtocol() functions have returned E OK (meaning all components have allowed the start of the protocol), the session state is reset to default session. Furthermore the DCM module shall ModeDeclarationGroupPrototype invoke the the mode switch of the **DcmDiagnosticSessionControl** bv SchM\_Switch\_Dcm\_<vendorApiInfix> DcmDiagnosticSessionControl(SchM\_MODE DcmDiagnosticSessionControl DcmConf DcmDspSessionRow DEFAULT SESSIO N) . J()

## 7.2.4.14.5 **Protocol stop**

A protocol stop can appear only in case of protocol preemption (See chapter 7.2.4.14.3 Preemption of protocol)

[Dcm624] [ With the reception of Dcm TpTxConfirmation() connected to the response given by the DSL submodule, the DCM shall not stop the current protocol (no call to xxx StopProtocol). ()

Note: A protocol (e.g. OBD) will be active till reset or other protocol preempts.

## 7.2.4.14.6 Parallel execution of diagnostic response

[Dcm081] The DCM module shall allow the parallel execution of protocol response in the case of ResponseOnEvent and PeriodicTransmission services. ()

The DCM provides module а configuration parameter **DcmDsIProtocollsParallelExecutab** to allow a protocol to be executed in parallel. Only protocols used for ResponseOnEvent and PeriodicTransmission services can have the configuration parameter **DcmDsIProtocollsParallelExecutab** set to TRUE.

#### 7.2.4.15 Manage resources

Due to limited resources, the following points should be considered as hints for the design:

- It is allowed to use and allocate only one diagnostic buffer in the DCM module. This buffer is then used for processing the diagnostic requests and responses.
- Output of NRC 0x78 (Response pending) responses is done with a separate buffer.
- paged-buffer handling (see Dcm028).

#### 7.2.4.16 **Communication Mode Handling**

## 7.2.4.16.1 No Communication

The ComM module will indicate the No Communication Mode to the DCM module by calling Dcm ComM NoComModeEntered(). In response, the DCM will immediately disable all transmissions (see the definition of Dcm ComM NoComModeEntered() for details).

### 7.2.4.16.2 Silent Communication

The ComM module will indicate the Silent Communication Mode to the DCM module by calling Dcm ComM SilentComModeEntered(). In response, the DCM will immediately disable all transmissions (see the definition of Dcm ComM SilentComModeEntered() for details).

### 7.2.4.16.3 Full Communication

The ComM module will indicate the Full Communication Mode to the DCM module by calling Dcm ComM FullComModeEntered(). In response, the DCM will enable all transmissions (see the definition of Dcm ComM FullComModeEntered() for details).

## 7.2.4.16.4 Default Session:

[Dcm163] With every request in default session of a diagnostic protocol, the DCM shall call ComM DCM ActiveDiagnostic (NetworkId), with the networkId associated to the received Pdu (see DcmDslProtocolRxChannelld), to inform the ComM module about the need to stay in Full Communication Mode. (1)

[Dcm164] [ With the reception of Dcm TpTxConfirmation() connected to the response given by the DSL submodule, the DCM shall call ComM DCM InactiveDiagnostic (NetworkId), with the networkId associated to the transmitted Pdu (see DcmDslProtocolRxChannelld), to inform the ComM module that Full Communication is not longer needed. ()

## [Dcm165] The DCM shall not call

ComM DCM InactiveDiagnostic (NetworkId) for NRC 0x78 (Response pending). The DCM shall only call ComM DCM InactiveDiagnostic (NetworkId) with the very last response (positive or negative) connected to the request. ()

[Dcm166] [ If a "suppressPosRspMsgIndicationBit" is indicated and the positive response will be suppressed, the DCM shall call

ComM DCM InactiveDiagnostic(NetworkId). ()

[Dcm697] \( \text{If a negative response is suppressed in case of functional addressing } \) (see Dcm001), the DCM shall call

ComM DCM InactiveDiagnostic(NetworkId).j()

### 7.2.4.16.5 Session Transitions:

[Dcm167] [ If the actual diagnostic session is changed into a session different than the default session (initiated by UDS Service DiagnosticSessionControl), the DCM shall call ComM DCM ActiveDiagnostic (NetworkId), with the networkId associated to the received Pdu, to inform the ComM module about the need to stay in Full Communication Mode. ()

**[Dcm168]** [ If the actual diagnostic session is changed from a session different than the default into the default session (initiated by UDS Service DiagnosticSessionControl or S3Server timeout or protocol preemption), then the DCM shall call ComM DCM InactiveDiagnostic (NetworkId), with the networkld associated to the received Pdu, to inform the ComM module that Full Communication is not longer needed. ()

### 7.2.4.16.6 Non Default Session:

[Dcm169] \( \text{As long as the server is in a session other than the default session, the DCM shall not call ComM DCM ActiveDiagnostic (NetworkId), with the networkld associated to the received Pdu, when receiving a request from a client provided by the PduR module. ()

[Dcm170] \( \text{As long as the server is in a session other than the default session, the DCM shall not call ComM DCM InactiveDiagnostic (NetworkId), with the networkId associated to the received Pdu, with the reception of Dcm TpTxConfirmation() connected to the response given by the DSL submodule. ()

# 7.3 DSD (Diagnostic Service Dispatcher)

## 7.3.1 Introduction

The DSD submodule is responsible to check the validity of an incoming diagnostic request (Verification of Diagnostic Session/Security Access levels/Application permission) and keeps track of the progress of a service request execution.

[Dcm178] The DSD submodule shall only process valid requests and shall reject invalid ones. ()

## 7.3.2 Use cases

The following use cases are relevant and are described in detail in the following:

- Receive a request message and transmit a positive response message
- Receive a request message and suppress a positive response
- Receive a request message and suppress a negative response
- Receive a request message and transmit a negative response message
- Send a positive response message without corresponding request
- Segmented Responses

## 7.3.2.1 Receive a request message and transmit a positive response message

This is the standard use case of normal communication ("ping-pong"). The server receives a diagnostic request message. The DSD submodule ensures the validity of the request message. In this use case, the request is valid and the response will be positive. The request will be forwarded to the appropriate data processor in the DSP submodule.

When the data processor has finished all actions of data processing, it triggers the transmission of the response message by the DSD submodule.

If the data processor processes the service immediately as part of the request indication function, the data processor can trigger the transmission inside this indication function ("synchronous").

If the processing takes a longer time (e. g. waiting on EEPROM driver), the data processor defers some processing ("asynchronous"). The response pending mechanism is covered by the DSL submodule. The data processor triggers the transmission explicitly, but from within the data processor's context.

As soon as a request message is received, the corresponding DcmPduld is blocked by the DSL submodule (see Dcm241). During the processing of this request, no other request of the same protocol type (e.g. an enhanced session can be ended by a OBD session) can be received, until the corresponding response message is sent and the DcmPduld is released again.

## 7.3.2.2 Receive a request message and suppress a positive response

This is a sub-use-case of the previous one.

Within the UDS protocol it is possible to suppress the positive response by setting a special bit in the request message (see Dcm200). This special suppression handling is completely performed within the DSD submodule.

## 7.3.2.3 Receive a request message and suppress a negative response

In case of functional addressing the DSD submodule shall suppress the negative response for NRC 0x11, 0x12 and 0x31 (see Dcm001)

## 7.3.2.4 Receive a request message and transmit a negative response message

There are a many different reasons why a request message is rejected and a negative response is to be sent.

If a diagnostic request is not valid or if a request may not be executed in the current session, the DSD submodule will reject the processing and a negative response will be returned.

But there are even many reasons to reject the execution of a well-formed request message, e.g. if the ECU or system state does not allow the execution. In this case, the DSP submodule will trigger a negative response including an NRC supplying additional information why this request was rejected.

In case of a request composed of several parameters (e.g. a UDS Service ReadDataByldentifier (0x22) request with more than one identifier to read), each parameter is treated separately. And each of these parameters can return an error. This kind of request returns a positive response if at least one of the parameters was processed successfully. If all of these parameters reports an error, the DSD submodule shall transmit a negative response with the first NRC reported and no positive response shall be send for this request.

## 7.3.2.5 Send a positive response message without corresponding request

There are two services within the UDS protocol, where multiple responses are sent for only one request. In general, one service is used to enable (and disable) an event- or time-triggered transmission of another service, which again is sent by the ECU without a corresponding request (see ISO14229-1 [14]).

These services are:

- UDS Service ReadDataByPeriodicIdentifier (0x2A). This service allows the client to request the periodic transmission of data record values from the server identified by one or more periodicDataIdentifiers.
  - Type 1 = USDT messages on the DcmTxPduld already used for normal diagnostic responses (single frames only);
  - Type 2 = UUDT message on a separate DcmTxPduId.
  - For Type 1, the outgoing messages must be synchronized with "normal outgoing messages", which have a higher priority.
- ResponseOnEvent (0x86). This service requests a server to start or stop transmission of responses on a specified event.
  - Way 1 = USDT messages on the DcmTxPduld already used for normal diagnostic responses.
  - Way 2 = USDT messages on separate DcmTxPduId.
  - For Way 1, the outgoing messages must be synchronized with "normal outgoing messages", which have a higher priority.

This handling is especially controlled by the DSL submodule. However, the DSD submodule also provides the possibility to generate a response without a corresponding request.

## 7.3.2.6 Segmented Responses (paged-buffer)

Within the diagnostic protocol, some services allow to exchange a significant amount of data, e.g. UDS Service ReadDTCInformation (0x19) and UDS Service TransferData (0x36).

In the conventional approach, the ECU internal buffer must be large enough to keep the longest data message which is to be exchanged (worst-case) and the complete buffer is filled before the transmission is started.

RAM memory in an ECU often is a critical resource, especially in smaller micros. In a more memory-saving approach, the buffer is filled only partly, transmitted partly and then refilled partly – and so on. This paging mechanism requires only a significantly reduced amount of memory, but demands a well-defined reaction time for buffer refilling.

The user can decide whether to use the "linear buffer" or paged-buffer for diagnostics.

## 7.3.3 Interaction of the DSD with other modules

The DSD submodule is called by the DSL submodule when receiving a diagnostic message and performs the following operations:

- delegates processing of request to the DSP submodule
- keeps track of request processing (provide Dcm ExternalProcessingDone() API)
- transmits the response of the Application to the DSL submodule (Transmit functionality)

## 7.3.3.1 Interaction of the DSD with the DSL main functionality

Direction	Explanation
Bidirectional	Exchange of the Diagnostic Messages (receive/transmit).
DSD submodule to DSL submodule	Obtain latest diagnostic session and latest security level.
DSL submodule to DSD submodule	Confirmation of transmission of Diagnostic Message.

Table 2 Interaction between the DSD submodule and the DSL submodule

### 7.3.3.2 Interaction of the DSD with the DSP

Direction	Explanation
DSD submodule	-Delegate processing of request.
to DSP	-Confirmation of transmission of Diagnostic Message.
submodule	
DSP submodule	-Signal that processing is finished.
to DSD	
submodule	

Table 3 Interaction between the DSD submodule and the DSP submodule

# 7.3.4 Functional Description of the DSD

# 7.3.4.1 Support checking the diagnostic service identifier and adapting the diagnostic message

The DSD submodule shall be triggered by the DSL submodule if a new diagnostic message is recognized. The DSD submodule will start processing by analyzing the diagnostic service identifier contained in the received diagnostic message.

[Dcm084] [ If configured (configuration parameter

**DcmRespondAllReguest**=FALSE), if the DCM module receives a diagnostic request that contains a service ID that is in the range from 0x40 to 0x7F or in the range from 0xC0 to 0xFF, the DCM shall not respond to such a request. (1)

This range corresponds to the diagnostic response identifier.

[Dcm192] [ The DSD submodule shall analyze the (incoming) diagnostic message for the diagnostic service identifier (based on first byte of the diagnostic message) and shall check the supported services with the newly received diagnostic service identifier. ()

[Dcm193] During this check, the DSD submodule shall search the newly received diagnostic service identifier in the "Service Identifier Table". ()

For performance reasons it might be necessary that the support check is done with a "lookup table" functionality. In this "Service Identifier Table" all supported Service IDs of the ECU are predefined.

[Dcm195] The DSL submodule shall provide the current "Service Identifier Table"<sub>→</sub>()

Rationale for Dcm195: The "Service Identifier Table" and the information about the supported services will be generated out of the configuration. More than one Service Identifier Table can be configured for selection. At one time only one Service Identifier Table can be active.

[Dcm196] For the check, the DSD submodule shall scan the active "Service" Identifier Table" for a newly received diagnostic service identifier. If this service identifier is supported and if the configuration parameter **DcmDsdSidTabFnc** (see Dcm777 Conf) is not empty, the DSD submodule shall call the configured service interface (<Module> <DiagnosticService>). If the configuration parameter is empty, the DCM shall call the internally implemented service interface. (1)

The diagnostic service identifier is not supported when it is not included in the "Service Identifier Table".

**[Dcm197]** If the newly received diagnostic service identifier is not supported, the DSD submodule shall transmit a negative response with NRC 0x11 (Service not supported) to the DSL submodule. ()

[Dcm198] The DSD submodule shall store the newly received diagnostic service identifier for later use. ()

### For example:

WriteDataByldentifier (for writing VIN number):

- 1. A new diagnostic message is received by the DSL submodule. (Diagnostic Message WriteDataByIdentifier =
- 0x2E,0xF1,0x90,0x57,0x30,0x4C,0x30,0x30,0x30,0x30,0x34,0x33,0x4D,0x42,0x35,0 x34,0x31,0x33,0x32,0x36)
- 2. The DSL submodule indicates a new diagnostic message with the "Data Indication" functionality to the DSD submodule. In the diagnostic message buffer the diagnostic message is stored (buffer = 0x2E,0xF1,0x90,...).
- 3. The DSD submodule executes a check of the supported services with the determined service identifier (first byte of buffer 0x2E) on the incoming diagnostic message.
- 4. The incoming diagnostic message is stored in the DCM variable Dcm MsgContextType.

### 7.3.4.2 Handling of "suppressPosRspMsqIndicationBit"

The "suppressPosRspMsqIndicationBit" is part of the subfunction parameter structure (Bit 7 based on second byte of the diagnostic message, see ISO14229-1 [14] Section 6.5: Server response implementation rules).

[Dcm200] [ If the "suppressPosRspMsgIndicationBit" is TRUE, the DSD submodule shall NOT send a positive response message. (BSW04020)

[Dcm201] The DSD submodule shall remove the "suppressPosRspMsgIndicationBit" (by masking the Bit) from the diagnostic message. ()

[Dcm202] The DCM module shall transport the information on a suppression of a positive response being active (between the layers) via the parameter Dcm MsqContextType. ()

[Dcm203] \( \text{In case of responsePending the DCM module shall clear the } \) "suppressPosRspMsgIndicationBit." ()

Rationale for Dcm203: In the described case the final response (negative/positive) is required.

[Dcm204] The DCM module shall only perform the "suppressPosRspMsgIndicationBit" handling when the configuration parameter **DcmDsdSidTabSubfuncAvail** is set for the newly received service identifier ()

Rationale for Dcm204: The "suppressPosRspMsgIndicationBit" is only available if a service has a subfunction.

### 7.3.4.3 Verification functionality

The DSD submodule will only accept a service, if the following three verifications are passed:

- 1. Verification of the Diagnostic Session
- 2. Verification of the Service Security Access levels
- 3. Verification of the Application environment/permission

#### 7.3.4.3.1 Verification of the Diagnostic Session

The UDS Service DiagnosticSessionControl (0x10) is used to enable different diagnostic sessions in the ECU (e.g. Default session, Extended session). A diagnostic session enables a specific set of diagnostic services and/or functionality in the ECU. It furthermore enables a protocol-depending data set of timing parameters applicable to the started session.

On receiving a service request, the DSD module will obtain the current Diagnostic Session with Dcm GetSesCtrlType() and will verify whether the execution of the requested service (NOT the UDS Service DiagnosticSessionControl (0x10)) and subservice is allowed in the current diagnostic session or not.

Note that the handling of the UDS Service DiagnosticSessionControl (0x10) itself is not part of the DSD submodule.

[Dcm211] [ If the newly received diagnostic service is not allowed in the current Diagnostic Session (according to the configuration parameter DcmDsdSidTabSessionLevelRef), the DSD submodule shall transmit a negative response with NRC 0x7F (serviceNotSupportedInActiveSession) to the DSL submodule. ()

[Dcm616] \( \text{If the newly received diagnostic service is allowed in the current} \) Diagnostic Session ( see <u>Dcm211</u>), but the requested subservice is not allowed in the current Diagnostic Session (according to the configuration parameter DcmDsdSubServiceSessionLevelRef), the DSD submodule shall transmit a negative response with NRC 0x7E (subFunctionNotSupportedInActiveSession) to the DSL submodule. ()

### 7.3.4.3.2 Verification of the Service Security Access levels

The purpose of the Security Access level handling is to provide a possibility to access data and/or diagnostic services, which have restricted access for security, emissions, or safety reasons. The DSD submodule shall perform this handling with the UDS Service SecurityAccess (0x27). The DSD submodule will perform a verification whether the execution of the requested service (NOT the UDS Service SecurityAccess (0x27)) is allowed in the current Security level by asking for the current security level, using the DSL function Dcm GetSecurityLevel(). The management of the security level is not part of the DSD submodule.

Note: For some use cases (e.g. UDS Service ReadDataByldentifier (0x22), where some Dataldentifier can be secure) it will be necessary for the Application to call also the function Dcm GetSecurityLevel().

[Dcm217] \( \text{If the newly received diagnostic service is not allowed in the current } \) Security level (according to the configuration parameter DcmDsdSidTabSecurityLevelRef), the DSD submodule shall transmit a negative response with NRC 0x33 (Security access denied) to the DSL submodule. (1)

[Dcm617] [ If the newly received diagnostic service is allowed in the current Security level (see Dcm217), but the requested subservice is not allowed in the current Security level (according to the configuration parameter DcmDsdSubServiceSecurityLevelRef), the DSD submodule shall transmit a negative response with NRC 0x33 (Security access denied) to the DSL submodule. ()

### 7.3.4.3.3 Verification of the Service mode dependencies

Dcm773 If the newly received diagnostic service is not allowed in the current mode condition (according to the configuration parameter *DcmDsdSidTabModeRuleRef*), the DSD submodule shall transmit the calculated negative response of the referenced DcmModeRule to the DSL submodule. ()

**Dcm774** If the newly received diagnostic service is allowed in the current mode condition (Dcm773), but the requested subservice is not allowed in the current mode condition (according to the configuration parameter

DcmDsdSubServiceModeRuleRef), the DSD submodule shall transmit the calculated negative response of the referenced DcmModeRule to the DSL submodule. ()

### 7.3.4.4 Check format and subfunction support

The DSD submodule checks whether a specific subfunction is supported before executing the requested command.

[Dcm273] The DSD submodule shall trigger a negative response with NRC 0x12 (SubFunction not supported), when the analysis of the request message results in subfunction not supported. ()

The DSD submodule will check for the minimum message length before executing the requested command.

[Dcm696] The DSD submodule shall trigger a negative response with NRC 0x13 (Incorrect message length or invalid format), if the length of the request is inferior to the minimul length of the request. ()

### 7.3.4.4.1 Verification of the Manufacturer Application environment/permission

The purpose of this functionality is that, just after receiving the diagnostic request, the Manufacturer Application is requested to check permission/environment. E.g. in after-run ECU state, it might be not allowed to process OBD requests.

[Dcm218] ☐ If configured (configuration parameter

DcmRequestManufacturerNotificationEnabled=TRUE), the DSD submodule shall call the operation Xxx Indication () on all configured ServiceRequestIndication ports (see configuration parameter

DcmDsIServiceRequestManufacturerNotification). ()

[Dcm462] [ If at least a single Xxx Indication() function called according to Dcm218 returns E REQUEST NOT ACCEPTED, the DSD submodule shall give no response. ()

[Dcm463] [ If at least a single Xxx Indication() function called according to Dcm218 has returned E NOT OK and no function has returned E REQUEST NOT ACCEPTED, the DSD submodule shall trigger a negative response with NRC from the ErrorCode parameter. ()

### 7.3.4.4.2 Verification of the Supplier Application environment/permission

The purpose of this functionality is that, right before processing the diagnostic message, the Supplier Application is requested to check permission/environment. E.g. in after-run ECU state, it might be not allowed to process OBD requests.

**[Dcm516]** ☐ If configured (configuration parameter

DcmRequestSupplierNotificationEnabled=TRUE), the DSD submodule shall call the operation Xxx Indication () on all configured ServiceRequestIndication ports (see configuration parameter **DcmDslServiceRequestSupplierNotification**). (()

[Dcm517] [ If at least a single Xxx Indication() function called according to Dcm516 returns E REQUEST NOT ACCEPTED, the DSD submodule shall give no response. ()

[Dcm518] [ If at least a single Xxx Indication() function called according to Dcm516 has returned E NOT OK and no function has returned E REQUEST NOT ACCEPTED, the DSD submodule shall trigger a negative response with NRC from the ErrorCode parameter. ()

#### 7.3.4.5 Distribution of diagnostic message to DSP submodule

[Dcm221] The DSD submodule shall search for the executable functionality of the DSP submodule for newly received diagnostic service identifier and shall call the corresponding DSP service interpreter. ()

### 7.3.4.6 Assemble positive or negative response

[Dcm222] \text{ When the DSP submodule has finished the execution of the requested Diagnostic Service the DSD submodule shall assemble the response. ()

The execution of the DSP service interpreter can have the results:

R4.0 Rev 3

- positive Result or
- negative Result.

Following possible Responses can be assembled:

- positive Response,
- negative Response, or
- no Response (in the case of suppression of responses).

### 7.3.4.6.1 Positive Response

The DSP submodule indicates a positive result by calling  $Dcm\_ExternalProcessingDone()$ . The parameter "Dcm\_MsgContextType" comprises the diagnostic (response) message.

[Dcm223] ☐ The DSD submodule shall add the response service identifier and the response data stream (returned by the Application) in the parameter "Dcm\_MsgContextType". ☐()

[Dcm224] \( \text{The DSD submodule shall therefore transfer the Dcm\_MsgContextType into a (response) buffer and shall add the service identifier at the first byte of the buffer. \( \)()

[Dcm225] ☐ The DSD submodule shall execute the "Initiate transmission" functionality in the next execution step ()

### 7.3.4.6.2 **Negative Response**

The DSP submodule can trigger the transmission of a negative response with a specific NRC to the DSD submodule.

For the allowed NRC of the executed Service ID please refer to the specification of the service in ISO14229-1 [14] (see Section 4.2.4 Response code parameter definition Table 12) and ISO15031-5 [15]. The DSP and the Application have to take care of the correct use of NRC of the executed Service ID.

[Dcm228] [ The DSD submodule shall handle all NRCs supported from the Application and defined in Dcm NegativeResponseCodeType. |()

### 7.3.4.6.3 Suppression of response

[Dcm231] \( \text{In the case that the "suppressPosRspMsgIndicationBit" is indicated in the functionality "Handling of suppressPosRspMsgIndicationBit" (stored in the Variable Dcm MsgContextType (Element: Dcm MsgAddInfo)), the DSD submodule shall activate the suppression of Positive Responses. ()

[Dcm001] \( \text{In the case of a Negative Result of the execution and active Functional } \) Addressing the DSD submodule shall activate the suppression of the following Negative Responses:

NRC 0x11 (Service not supported).

NRC 0x12 (SubFunction not supported),

NRC 0x31 (Request out of range). (BSW04020)

#### 7.3.4.7 Initiate transmission

[Dcm232] The DSD submodule shall forward the diagnostic (response) message (positive or negative response) to the DSL submodule. (1)

[Dcm237] The DSL submodule shall forward the diagnostic (response) message (positive or negative response) further to the PduR module by executing a DSL transmit functionality. ()

The DSL submodule will receive a confirmation by the PduR module upon forwarding the data.

[Dcm235] The DSL submodule shall forward the received confirmation from the PduR module to the DSD submodule. ()

[Dcm236] The DSD submodule shall forward the confirmation via the internal function DspInternal DcmConfirmation() to the DSP submodule. ()

[Dcm238] \( \text{In the case that no diagnostic (response) message shall be sent (Suppression of Responses) the DSL submodule shall not transmit any response. (1)

In this case no Data Confirmation is sent from the DSL submodule to the DSD submodule the DSD submodule will still internal function but call DspInternal DcmConfirmation().

[Dcm240] The DSD submodule shall always finish the processing of one Diagnostic Message of the Diagnostic Service Dispatcher by calling

DspInternal DcmConfirmation().()

Rationale for Dcm240: The DSP submodule is waiting for the execution of the DspInternal DcmConfirmation() functionality. So it has to be sent, also when no Data Confirmation is provided.

Altogether this means that in any of the following cases:

- Positive Response.
- Negative Response,
- Suppressed Positive Response, and
- Suppressed Negative Response

the DSD submodule will finish by calling DspInternal DcmConfirmation().

Dcm741 The DSD submodule shall call the operation Xxx Confirmation() on all ports using the ServiceRequestNotification interface (see configuration parameter DcmDslServiceRequestManufacturerNotification and

DcmDslServiceRequestSupplierNotification) ()

Dcm742 The call of Xxx Confirmation() shall be done right after the call of DspInternal DcmConfirmation() ()

Dcm770 The DSD submodule shall call the operation Xxx Confirmation() on all ports using the ServiceRequestNotification interface (see configuration parameter DcmDslServiceRequestManufacturerNotification and

DcmDslServiceRequestSupplierNotification). ()

# 7.4 Diagnostic Service Processing – DSP

### 7.4.1 General

When receiving a function call from the DSD submodule requiring the DSP submodule to process a diagnostic service request, the DSP always carries out following basic process steps:

- analyze the received request message,
- check format and whether the addressed subfunction is supported.
- acquire data or execute the required function call on the DEM, SW-Cs or other BSW modules
- assemble the response

The following sections are some general clarifications.

### 7.4.1.1 Check format and subfunction support

The DSP submodule will check for appropriate message length and structure before executing the requested command.

[Dcm272] The DSP submodule shall trigger a negative response with NRC 0x13 (Incorrect message length or invalid format), when the analysis of the request message results in formatting or length failure. ()

Note: It is up to the implementation in which detail the format check might be executed and depends on the level of detail the diagnostic data description provides at compile time.

### 7.4.1.2 Assemble response

[Dcm039] The DSP submodule shall assemble the response message excluding response service identifier and determine the response message length. ()

[Dcm038] [ If the paged-buffer mechanism is used, the DSP submodule shall determine the overall response length before any data is passed to the DSD submodule or the DSL submodule respectively. (BSW04017)

Requirement Dcm038 is needed because of segmented diagnostic data transmission on CAN using ISO15765-2 [16], which requires the provision of the overall length of the complete data stream in the very first CAN frame of the respective data transmission (please refer to Section 7.2.4.8 for details about the paged-buffer mechanism).

[Dcm269] The DSP submodule shall confirm the completion of the request processing with the function call Dcm External Processing Done (). ()

### 7.4.1.3 Additional Negative Response Codes (NRCs)

[Dcm271] The DSP submodule shall trigger a negative response with NRC 0x22 (Conditions not correct), when the API calls made to execute the service do not return OK. ()

[Dcm275] The DSP submodule shall trigger a negative response with NRC 0x31 (Request out of range), when the analysis of the request message results in other unsupported message parameters. ()

### 7.4.1.4 Diagnostic mode declaration groups

**Dcm775** The DCM shall act as a mode manager for the diagnostic modes:

- 1) DcmDiagnosticSessionControl (service 0x10)
- 2) DcmEcuReset (partly service 0x11)
- 3) DcmModeRapidPowerShutDown (partly service 0x11)
- 4) DcmCommunicationControl <symbolic name of ComMChannelld>. (service 0x28)
- 5) DcmControlDTCSetting (service 0x85) ()

Note: The RTE/SchM will prefix the names with "MODE", wherefore the names do not include the MODE keyword.

Dcm776 | The DCM SWS defines the mode of its *ModeDeclarationGroups*. |()

**Dcm778** For ModeDeclarationGroup Dcm DiagnosticSessionControl, the mode declaration shall be identical to the symbolic names of the parameter DcmDspSessionLevel:

```
ModeDeclarationGroup DcmDiagnosticSessionControl {
               cprefix>DefaultSession,
               prefix>ProgrammingSession,
               cprefix>ExtendedSession.
               etc.
               initialMode = cprefix>DefaultSession
```

}; <sub>|</sub>()

Note: Refer [ecuc sws 2108] defining the symbolic name prefix

Dcm806 The DCM shall define the ModeDeclarationGroupPrototype DcmDiagnosticSessionControl as provided-ModeGroup based on the

**ModeDeclarationGroup** DcmDiagnosticSessionControl. (()

```
Dcm777 The DCM shall define the ModeDeclarationGroupPrototype
DcmEcuReset as provided-ModeGroup based on the following
ModeDeclarationGroup:
ModeDeclarationGroup DcmEcuReset {
 NONE,
 HARD
 KEYONOFF,
 SOFT.
 JUMPTOBOOTLOADER,
 JUMPTOSYSSUPPLIERBOOTLOADER.
 EXECUTE
     initialMode = NONE
};]()
Dcm807 The DCM shall define the ModeDeclarationGroupPrototype
DcmRapidPowerShutDown as provided-ModeGroup based on the following
ModeDeclarationGroup:
ModeDeclarationGroup DcmModeRapidPowerShutDown {
 ENABLE RAPIDPOWERSHUTDOWN,
 DISABLE RAPIDPOWERSHUTDOWN
     initialMode = ENABLE RAPIDPOWERSHUTDOWN
};]()
Dcm779 For ModeDeclarationGroup Dcm CommunicationControl the mode
declarations shall be identical to the enumarations of the type
Dcm CommunicationModeType. The initial mode shall be set to
DCM ENABLE RX TX NORM ()
Dcm780 The DCM shall define for each network which is considered in the
CommunicationControl service a separate ModeDeclarationGroupPrototype with
the naming convention DcmCommunicationControl <symbolic name of
ComMChannelld>. 1()
```

```
Dcm781 The DCM shall define the ModeDeclarationGroupPrototype
DcmControlDTCSetting as provided-ModeGroup based on the following
ModeDeclarationGroup:
ModeDeclarationGroup DcmControlDTCSetting {
 ENABLEDTCSETTING,
 DISABLEDTCSETTING
     initialMode = ENABLEDTCSETTING
```

### 7.4.1.5 mode dependent request execution

The execution of a request can be limited depending on mode condition. This enables the DCM to formalize environmental checks.

Similar to a session/security check a further check (see Dcm773 and Dcm774) can be configured to the DCM. The referenced mode rule is arbitrating on to several mode declarations of a mode declaration groups in which the request can be processed. Otherwise a configurable NRC (see Dcm812) is responded.

Dcm808 The DcmModeRule shall evaluate all referenced DcmModeConditions and/or nested DcmModeRules either by a logial AND in case *DcmLogicalOperator* is set to DCM AND or by a logical OR in case the **DcmLogicalOperator** is set to DCM OR. In case only a single **DcmModeCondition** or **DcmModeRule** is referenced the **DcmLogicalOperator** shall not be present and therefore not be used. ()

Dcm809 FEach DcmModeConditions shall either have a DcmSwcModeRef or a DcmBswModeRef. ()

Dcm810 The DcmModeConditions shall evaluate if the referenced Mode-Declaration is set in case of **DcmConditionType** is set to DCM EQUALS or is not set in case of **DcmConditionType** is set to DCM\_EQUALS\_NOT. ()

Note: The current mode of the referenced ModeDeclarationGroupPrototypes could be read by either the API SchM MODE or by the API RTE MODE.

Dcm811 In case multiple DcmModeConditions are referenced within a DcmModeRule they shall be evaluated in order of the order of the **DcmArgumentRef** references in the ECUC file. |()

Note: This implies the priority of NRCs

**Dcm782** The DcmModeRule shall have an optional parameter DcmModeRuleNrcValue to define the NegativeResponseCode which is sent in case the service execution is prohibited due to the DcmModeRule. ()

Dcm812 In case a nested DcmModeRule contains also a DcmModeRuleNrcValue parameter, this NRC shall be used prior the higher-level NRC. ()

Dcm813 In case DcmLogicalOperator is set to DCM AND, the first failed DcmModeCondition shall be used to define the NRC for the response message. ()

Dcm814 In case DcmLogicalOperator is set to DCM OR, the last DcmModeCondition shall be used to define the NRC for the response message. ()

Note: The difference in the AND and OR logical operation is to allow an optimized implementation.

**Dcm815** In case the complete evaluation result in no specific NRC the NRC 0x22 (ConditionsNotCorrect) shall be used. (()

### 7.4.2 UDS Services

[Dcm442] The DCM module shall implement the services of UDS according to the following table:

SID	Service	Subfunction	Supported
0x10	DiagnosticSessionControl		supported
0x11	ECUReset		supported
0x14	ClearDiagnosticInformation		supported
0x19	ReadDTCInformation		supported
0x22	ReadDataByldentifier		supported
0x23	ReadMemoryByAddress		supported (callout)
0x24	ReadScalingDataByIdentifier		supported
0x27	SecurityAccess		supported
0x28	CommunicationControl		supported
0x2A	ReadDataByPeriodicIdentifier		supported
0x2C	DynamicallyDefineDataIdentifier		supported
0x2E	WriteDataByldentifier		supported
0x2F	InputOutputControlByIdentifier		supported
0x31	RoutineControl		supported

0x34	RequestDownload		supported (callout)
0x35	RequestUpload		supported (callout)
0x36	TransferData		supported
0x37	RequestTransferExit		supported
0x3D	WriteMemoryByAddress		supported (callout)
0x3E	TesterPresent	0x00, 0x80	supported
0x3E	TesterPresent	Not 0x00 and not 0x80	NRC "SubFunctionNotSupported"
0x83	AccessTimingParameter		NRC "ServiceNotSupported"
0x84	SecuredDataTransmission		NRC "ServiceNotSupported"
0x85	ControlDTCSetting	On, off	supported
0x86	ResponseOnEvent	All excepted onComparision OfValues	supported
0x86	ResponseOnEvent	onComparision OfValues	NRC "SubFunctionNotSupported"
0x87	LinkControl		Supported (jump to OEM bootloader)

Table 4: Support of UDS Services ()

# 7.4.2.1 General behavior using DEM interfaces

[Dcm007] The DCM requirements use the term DTCStatusAvailabilityMask to indicate the value returned by the function

Dem GetDTCStatusAvailabilityMask(). (BSW04010)

The mask DTCStatusAvailabilityMask reflects the status bits supported by the ECU.

[Dcm371] \( \text{To avoid updating data values while reading out extended data records,} \) the DCM module shall call the following API sequence: first lock updates by calling Dem DisableDTCRecordUpdate() (which is an exclusive area function concerning to BSW00434) then call Dem GetSizeOfExtendedDataRecordByDTC(), then Dem GetExtendedDataRecordByDTC (RecNum) and finally shall re-enable updates by calling Dem EnableDTCRecordUpdate(). ()

[Dcm372] \( \text{To avoid updating data values while reading out freeze frame records,} \) the DCM module shall call the following API sequence: first lock updates by calling Dem DisableDTCRecordUpdate() (which is an exclusive area function concerning to BSW00434) then call Dem GetSizeOfFreezeFrameByDTC (RecNum), then Dem GetFreezeFrameDataByDTC (RecNum) and finally shall re-enable updates by calling Dem EnableDTCRecordUpdate().()

[Dcm702] [ If function Dem DisableDTCRecordUpdate() returns DEM DISABLE DTCRECUP PENDING, the DCM shall retry to get the lock in the next Dcm MainFunction(). ()

Note: A timeout or maximum counter is not necessary, because the DEM guarantees not to lock the DTC for longer time.

[Dcm700] \( \text{When the DCM module receives a request with the DTCStatusMask set} \) to 0x00, it shall handle this value on its own and shall not use the DEM interface Dem SetDTCFilter().()

Note: The parameter DTCFormat of the functions Dem ClearDTC(), Dem SetFreezeFrameRecordFilter() Dem SetDTCFilter(), Dem GetNextFilteredDTCAndFDC() defines the output-format of the requested DTC values for the sub-sequent API calls.

For the 2-byte ISO15031-6 DTC format, the DTCFormat parameter shall be equal to DEM DTC FORMAT OBD. For the 2-byte ISO14229-1 DTC format, the DTCFormat parameter shall be equal to DEM DTC FORMAT UDS.

#### 7.4.2.2 UDS Service 0x10 – Diagnostic Session Control

UDS Service 0x10 allows an external tester to enable different diagnostic sessions in the server. A diagnostic session enables a specific set of diagnostic services and/or functionality in the server. The service request contains the parameter:

diagnosticSessionType

[**Dcm250**] The DCM module shall implement the UDS Service 0x10 (BSW04006)

[Dcm307] When responding to UDS Service 0x10, if the requested subfunction value is not configured in the ECU (configuration parameter **DcmDspSessionLevel**), the DSP submodule shall trigger a negative response with NRC 0x12 (SubFunction not supported). ()

If the requested subfunction value is configured, the following steps are processed even if the requested session type is equal to the already running session type (see ISO14229-1 [14] Section 8.2).

[Dcm311] The sent confirmation function shall set the new diagnostic session type with DslInternal SetSesCtrlType() and shall set the new timing parameters (P2ServerMax, P2ServerMax\*) (see configuration parameters

DcmDspSessionP2ServerMax and DcmDspSessionP2StarServerMax) and do the mode switch of the *ModeDeclarationGroupPrototype* 

DcmDiagnosticSessionControl by calling

SchM Switch Dcm <vendorApiInfix> DcmDiagnosticSessionControl() with the new diagnostic session type (see Dcm778). ()BSW04015)

[Dcm085] The DSP submodule shall manage internally a read access for the dataIdentifier 0xF186 (ActiveDiagnosticSessionDataIdentifier) defined in ISO14229-1 [14]. ()

#### 7.4.2.3 UDS Service 0x11 - ECUReset

UDS Service ECUReset (0x11) allows an external tester to request a server reset. The service request contains parameter:

resetType

[Dcm260] The DCM module shall implement the UDS Service ECUReset (0x11) |()

[Dcm373] [On reception of a request for UDS Service 0x11 with the sub functions other than enableRapidPowerShutDown (0x04) or disableRapidPowerShutDown (0x05). the DCM module shall trigger the mode switch ModeDeclarationGroupPrototype DcmEcuReset equal to the received resetType. After the mode switch is requested the DCM shall trigger he start of the positive response message transmission.

Sub function hardReset (0x01) to HARD

Sub function keyOffOnReset (0x02) to KEYONOFF.

Sub function softReset (0x03) to SOFT ()

Note: By this mode switch the DCM informs the BswM to prepare the shutdown of the ECU.

[Dcm594] On the transmit confirmation (call to Dcm TpTxConfirmation) of the positive response, the DCM module shall trigger the mode switch of ModeDeclarationGroupPrototype DcmEcuReset to the mode EXECUTE (via SchM Switch Dcm <vendorApiInfix> DcmEcuReset

(SchM MODE DcmEcuReset EXECUTE) ). ()

Note: By this final mode switch the DCM request the BswM to finally shutdown the ECU and to to perform the reset.

**Dcm818** [On reception of a request for UDS Service 0x11 with the sub functions enableRapidPowerShutdown (0x04) or disableRapidPowerShutdown (0x05), the DCM module shall trigger the mode switch of ModeDeclarationGroupPrototype DcmRapidPowerShutDown:

Sub function enableRapidPowerShutDown (0x04) to ENABLE RAPIDPOWERSHUTDOWN, Sub function disableRapidPowerShutDown (0x05) to DISABLE RAPIDPOWERSHUTDOWN ()

Note: If EnableRapidPowerShutdown is enabled, the ECU should shorten its powerdown time.

[Dcm589] In case the parameter DcmDspPowerDownTime is present, the DCM shall set the powerDownTime in positive response to sub-service enableRapidPowerShutDown with value set in DcmDspPowerDownTime. (1)

### 7.4.2.4 UDS Service 0x14 - Clear Diagnostic Information

UDS Service ClearDiagnosticInformation (0x14) requests an ECU to clear the error memory. The service request contains the parameter:

groupOfDTC.[

**Dcm247]** The DCM module shall implement UDS Service 0x14. (BSW04010)

[Dcm005] [Upon reception of a UDS Service ClearDiagnosticInformation (0x14) request with parameter groupOfDTC, the DCM module shall call the operation ClearDTC with the following parameter values:

DTC: groupOfDTC from the service request DTCFormat: DEM DTC FORMAT UDS

DTCOrigin: DEM\_DTC\_ORIGIN\_PRIMARY\_MEMORY\_(BSW04010, BSW04058, BSW04065)

[Dcm705] I In case Dem ClearDTC() returns DEM CLEAR OK, the DCM module shall send a positive response. ()

[Dcm706] In case Dem ClearDTC() returns DEM CLEAR PENDING, the DCM shall invoke Dem ClearDTC() on next Dcm MainFunction call again. It is up to the DCM to send NRC 78 to respect the response behaviour ()

[Dcm707] In case Dem ClearDTC() returns DEM CLEAR FAILED, the DCM shall send a negative response 0x22 – conditionsNotCorrect. ()

[Dcm708] In case Dem ClearDTC() returns DEM CLEAR WRONG DTC, the DCM shall send a negative response 0x31 – requestOutOfRange. ()

#### 7.4.2.5 UDS Service 0x19 – Read DTC Information

**[Dcm248]** The DCM module shall implement the UDS Service 0x19. (BSW04010)

**Dcm739** If a DEM STATUS PENDING value is returned from Dem\_GetStatusOfDTC, the DCM shall call the API (at least on each Dcm MainFunction cycle) again as long as DEM STATUS PENDING is returned (1)

**Dcm740** If a DEM FILTERED PENDING value is returned from Dem GetNextFilteredRecord or Dem GetNextFilteredDTCAndFDC, the DCM shall call the API (at least on each Dcm MainFunction cycle) again as long as DEM FILTERED PENDING is returned ()

#### 7.4.2.5.1 UDS Service 0x19 with subfunctions

0x01(reportNumberOfDTCByStatusMask), 0x07(reportNumberOfDTCBySeverityMaskRecord), 0x11(reportNumberOfMirrorMemoryDTCByStatusMask), 0x12(reportNumberOfEmissionsRelatedOBDDTCByStatusMask)

UDS Service 0x19 with subfunctions 0x01, 0x11 or 0x12 requests the ECU to report the number of DTCs matching tester-defined criteria. The service request contains the parameter:

DTCStatusMask

UDS Service 0x19 with subfunction 0x07 requests the ECU to report the number of DTCs matching tester-defined criteria. The service request contains the parameters:

- DTCSeverityMask
- DTCStatusMask

**[Dcm376]** When sending a positive response to UDS Service 0x19 with subfunction 0x01, 0x07, 0x11 or 0x12, the DCM module shall use the following data in the response message: (BSW04010)

Parameter name	Value	
DTCStatusAvailabilityMask	DTCStatusAvailabilityMask (see Dcm007)	
DTCFormatIdentifier	<pre>value returned by Dem_GetTranslationType()</pre>	
DTCCount	value calculated according to Dcm293	

[Dcm293] \tau When responding to UDS Service 0x19 with subfunction 0x01, 0x07, 0x11 or 0x12, the DCM module shall calculate the number of DTCs using Dem GetNumberOfFilteredDTC() after having set the DEM-filter with Dem SetDTCFilter() using the parameter values of the following table:

	reportNumber OfDTCByStat usMask	reportNumber OfDTCBySever ityMaskRecord	reportNumber OfMirrorMemo ryDTCByStatu sMask	reportNumberOfE missionsRelated OBDDTCByStatus Mask
	0x01	0x07	0x11	0x12
DTCStatusMask	DTCStatusMas k from request (see Dcm700)	DTCStatusMas k from request (see Dcm700)	DTCStatusMas k from request (see Dcm700)	DTCStatusMask from request (see Dcm700)
DTCKind	DEM_DTC_GR OUP_ALL_DT CS	DEM_DTC_GR OUP_ALL_DTC S	DEM_DTC_GR OUP_ALL_DT CS	EMISSION_REL_ DTCS

DTCOrigin	PRIMARY_ME MORY	PRIMARY_ME MORY	MIRROR_MEM ORY	PRIMARY_MEMO RY
FilterWithSeverity	NO	YES	NO	NO
DTCSeverityMask	Not relevant	DTCSeverityMa sk from request	Not relevant	Not relevant
FilterForFaultDete ctionCounter	NO	NO	NO	NO

(BSW04010, BSW04058, BSW04067)

### 7.4.2.5.2 UDS Service 0x19 with subfunctions

0x02(reportDTCBvStatusMask), 0x0A(reportSupportedDTCs),

0x0F(reportMirrorMemoryDTCByStatusMask),

0x13(reportEmissionsRelatedOBDDTCByStatusMask),

0x15(reportDTCWithPermantStatus)

UDS Service 0x19 with subfunctions 0x02, 0x0F or 0x13 requests the DTCs (and their associated status) that match certain conditions. The service request contains the parameter:

DTCStatusMask

UDS Service 0x19 with subfunction 0x0A requests all supported DTCs and their associated status. UDS Service 0x19 with subfunction 0x15 requests all DTCs with permanent status.

**[Dcm377]** When sending a positive response to UDS Service 0x19 with subfunction 0x02, 0x0A, 0x0F, 0x13 or 0x15, the DCM module shall use the following data in the response message: ()

Parameter name	Value
DTCStatusAvailabilityMask	DTCStatusAvailabilityMask (see Dcm007)
DTCAndStatusRecord As defined in Dcm008 and Dcm378	

[Dcm008] \( \text{On reception of a UDS Service 0x19 request with subfunction 0x02,} \) 0x0A, 0x0F, 0x13 or 0x15 and if DTCStatusAvailabilityMask (see Dcm007) is equal to 0, the DCM module shall answer positively with 0 DTC. ()

[Dcm378] \( \text{ When responding to UDS Service 0x19 with subfunctions 0x02, 0x0A, \) 0x0F, 0x13 or 0x15, the DCM module shall obtain the records with DTCs (and their associated status) by repeatedly calling <code>Dem GetNextFilteredDTC()</code> after having configured the filter with Dem SetDTCFilter() using the parameter values of the following table:

	reportDTC ByStatusM ask	reportSupp ortedDTCs	reportMirror MemoryDTC ByStatusMa sk	reportEmiss ionsRelated OBDDTCBy StatusMask	reportDTC WithPerma nentStatus
	0x02	0x0A	0x0F	0x13	0x15
DTCStatusMask	DTCStatus Mask from request (see Dcm700)	0x00	DTCStatusM ask from request (see Dcm700)	DTCStatusM ask from request (see Dcm700)	0x00
DTCKind	DEM_DTC_ GROUP_AL L_DTCS	DEM_DTC_ GROUP_AL L_DTCS	DEM_DTC_ GROUP_ALL _DTCS	EMISSION_ REL_DTCS	DEM_DTC_ GROUP_AL L_DTCS
DTCFormat	DEM_DTC_ FORMAT_ UDS	DEM_DTC_ FORMAT_U DS	DEM_DTC_F ORMAT_UD S	DEM_DTC_F ORMAT_UD S	DEM_DTC_ FORMAT_U DS
DTCOrigin	PRIMARY_ MEMORY	PRIMARY_ MEMORY	MIRROR_ME MORY	PRIMARY_M EMORY	PERMANE NT_MEMO RY
FilterWithSeverity	NO	NO	NO	NO	NO
DTCSeverityMask	Not relevant	Not relevant	Not relevant	Not relevant	Not relevant
FilterForFaultDete ctionCounter	NO	NO	NO	NO	NO

J(BSW04010, BSW04058, BSW04067)

Note:

- The DCM module can obtain the number of records that will be found using Dem GetNextFilteredDTC() Dem GetNumberOfFilteredDTC(). This allows the implementation to calculate the total size of the response before cycling through the DTCs.
- The value 0x00 used as DTCStatusMask for the subfunctions 0x0A and 0x15 disables the status byte filtering in Dem SetDTCFilter().

When using paged buffer mechanism, in some case, it's possible that the number of DTC matching the filter change between the calculation of the total size, needed for the first page transmission, and the sending of the further pages. For this reason, the following requirement apply:

[Dcm587] The DCM shall limit the response size to the size calculated when sending the first page. If more DTCs match the filter after this sending, the additional DTCs shall not be considered. ()

[Dcm588] The DCM shall pad the response with the size calculated when sending the first page. If less DTC matche the filter after this sending, the missing DTCs shall be padded with 0 value as defined in 15031-6. ()

# 7.4.2.5.3 UDS Service 0x19 with subfunction 0x08 (report DTC by Severity Mask Record)

UDS Service 0x19 with subfunction 0x08 requests the DTCs and the associated status that match a tester-defined severity mask record. The service request contains the following parameters:

- DTCSeverityMask
- DTCStatusMask

[Dcm379] \( \text{ When sending a positive response to UDS Service 0x19 with } \) subfunction 0x08, the DCM module shall use the following data in the response message:

Parameter name	Value
DTCStatusAvailabilityMask	DTCStatusAvailabilityMask (see Dcm007)
DTCAndSeverityRecord	As defined in Dcm380

]()

[Dcm380] \( \text{When responding to UDS Service 0x19 with subfunction 0x08, the DCM} \) module shall obtain the DTCAndSeverityRecords by repeatedly calling Dem GetNextFilteredDTCAndSeverity() after having configured the filter with Dem SetDTCFilter() using the parameter values of the following table:

	reportDTCBySeverityMaskRec ord
DTCStatusMask	DTCStatusMask from request (see Dcm700)
DTCKind	DEM_DTC_GROUP_ALL_DTC S
DTCFormat	DEM_DTC_FORMAT_UDS
DTCOrigin	PRIMARY_MEMORY
FilterWithSeverity	YES
DTCSeverityMask	DTCSeverityMask from request
FilterForFaultDetectionCo	NO

(BSW04010)

Note: The DCM module can obtain the number of records that will be found using Dem GetNextFilteredDTCAndSeverity() by using Dem GetNumberOfFilteredDTC().

# 7.4.2.5.4 UDS Service 0x19 with subfunction 0x09 (report Severity Information of DTC)

UDS Service 0x19 with subfunction 0x09 requests the severity information of a DTC. The service request contains the parameter:

DTCMaskRecord

[Dcm381] \( \text{ When sending a positive response to UDS Service 0x19 with subfunction } \) 0x09, the DCM module shall use the following data in the response message:

Parameter name	Value	
DTCStatusAvailabilityMask	DTCStatusAvailabilityMask (see Dcm007)	
DTCAndSeverityRecord	<pre>DTCSeverityMask: use Dem GetSeverityOfDTC()</pre>	
	DTCFunctionalUnit : use	
	<pre>Dem GetFunctionalUnitOfDTC()</pre>	
	DTCxxx : the given DTC of the request	
	<pre>statusOfDTC:use Dem GetStatusOfDTC() with</pre>	
	parameters value:	
	DTC: DTC from the request	
	DTCOrigin: DEM DTC ORIGIN PRIMARY MEMORY	

(BSW04010)

# 7.4.2.5.5 Service 0x19 subfunctions 0x06/0x10 + DTC + 0xFF - Report all **Extended Data Records for a particular DTC**

**UDS** Service 0x19with subfunction 0x06or 0x10and DTCExtendedDataRecordNumber=0xFF requests all Extended Data Records for a specific DTC. The request contains:

- DTCMaskRecord
- DTCExtendedDataRecordNumber (equal to 0xFF)

[Dcm297] \( \text{ When sending a positive response to UDS Service 0x19 with } \) subfunction 0x06 or 0x10 and DTCExtendedDataRecordNumber=0xFF, the DCM module shall use the following data in the response message:

Parameter name	Value
DTCAndStatusRecord	see Dcm295
DTCExtendedDataRecordNumber	see Dcm296
DTCExtendedDataRecord	see Dcm296

]()

[Dcm295] When responding to UDS Service 0x19 with subfunction 0x06 or 0x10, the DCM module shall calculate the statusOfDTC by calling Dem GetStatusOfDTC() with the following parameters:

	reportDTCExtendedDataRe cordByDTCNumber	reportMirrorMemoryDTCExte ndedDataRecordByDTCNum ber
	0x06	0x10
DTC	DTCMaskRecord from request	DTCMaskRecord from request
DTCOrigin	PRIMARY MEMORY	MIRROR MEMORY

(BSW04010, BSW04058)

[Dcm296] When responding to UDS Service 0x19 with subfunction 0x06 or 0x10, the DCM module shall assemble the ExtendedDataRecords by calling Dem GetExtendedDataRecordByDTC() repeatedly (where ExtendedDataNumber goes from 0x01 to 0xEF) with the following parameter values:

	reportDTCExtendedDataRe cordByDTCNumber	reportMirrorMemoryDTCExte ndedDataRecordByDTCNum ber
	0x06	0x10
DTC	DTCMaskRecord from request	DTCMaskRecord from request
DTCOrigin	PRIMARY_MEMORY	MIRROR_MEMORY
ExtendedDataNumber	0x01 to 0xEF	0x01 to 0xEF

(BSW04010, BSW04058)

The DTCExtendedDataRecordNumber is equal to the ExtendedDataNumber, which DEM interface IN parameter in the an Dem GetExtendedDataRecordByDTC().

[Dcm478] The DCM module shall obtain the size of the data returned by DEM in Dem GetExtendedDataRecordByDTC() call by using Dem GetSizeOfExtendedDataRecordByDTC(). (BSW04010)

To get the size of all extended data. the DCM module call Dem GetSizeOfExtendedDataRecordByDTC() with ExtendedDataNumber set to 0xFF.

# 7.4.2.5.6 Service 0x19 subfunctions 0x06/0x10 + DTC + 0xFE - Report all OBD **Extended Data Records for a particular DTC**

**UDS** Service 0x19 with subfunction 0x06 or 0x10and DTCExtendedDataRecordNumber=0xFE requests all OBD Extended Data Records for a specific DTC. The request contains:

- DTCMaskRecord
- DTCExtendedDataRecordNumber (equal to 0xFE)

[Dcm474] When sending a positive response to UDS Service 0x19 with subfunction 0x06 or 0x10 and DTCExtendedDataRecordNumber=0xFE, the DCM module shall use the following data in the response message:

Parameter name	Value
DTCAndStatusRecord	see Dcm475
DTCExtendedDataRecordNumber	see <u>Dcm476</u>
DTCExtendedDataRecord	see Dcm476

1()

[Dcm475] When responding to UDS Service 0x19 with subfunction 0x06 or 0x10. the DCM module shall calculate the statusOfDTC by calling Dem GetStatusOfDTC() with the following parameters:

	reportDTCExtendedDataRe cordByDTCNumber	reportMirrorMemoryDTCExte ndedDataRecordByDTCNum ber
	0x06	0x10
DTC	DTCMaskRecord from request	DTCMaskRecord from request
DTCOrigin	PRIMARY_MEMORY	MIRROR_MEMORY

(BSW04010, BSW04058)

[Dcm476] When responding to UDS Service 0x19 with subfunction 0x06 or 0x10, the DCM module shall assemble the ExtendedDataRecords by calling Dem GetExtendedDataRecordByDTC() repeatedly (where ExtendedDataNumber goes from 0x90 to 0xEF) with the following parameter values:

	reportDTCExtendedDataRe cordByDTCNumber	reportMirrorMemoryDTCExte ndedDataRecordByDTCNum ber
	0x06	0x10
DTC	DTCMaskRecord from request	DTCMaskRecord from request
DTCOrigin	PRIMARY_MEMORY	MIRROR_MEMORY
ExtendedDataNumber	0x90 to 0xEF	0x90 to 0xEF

(BSW04010, BSW04058)

The DTCExtendedDataRecordNumber is equal to the ExtendedDataNumber, which in the DEM interface used an IN parameter is Dem GetExtendedDataRecordByDTC().

As required in Dcm478, the DCM module shall obtain the size of the extended data record by using Dem GetSizeOfExtendedDataRecordByDTC().

To get the size of all OBD related extended data, the DCM call Dem GetSizeOfExtendedDataRecordByDTC() module ExtendedDataNumber set to 0xFE.

# 7.4.2.5.7 Service 0x19 subfunctions 0x06/0x10 + DTC + (not 0xFF nor 0xFE) -Report one specific Extended Data Record for a particular DTC

The UDS Service 0x19 with subfunction 0x06 0x10 and DTCExtendedDataRecordNumber different from 0xFF or 0xFE requests a specific Extended Data Records for a specific DTC. The service request contains the parameters:

- DTCMaskRecord
- DTCExtendedDataRecordNumber (different from 0xFF or 0xFE)

[Dcm386] \( \text{ When sending a positive response to UDS Service 0x19 with } \) subfunction 0x06 or 0x10 and DTCExtendedDataRecordNumber different from 0xFF or 0xFE, the DCM module shall use the following data in the response message:

Parameter name	Value
DTCAndStatusRecord	see Dcm295
DTCExtendedDataRecordNumber	DTCExtendedDataRecordNumber
	from request
DTCExtendedDataRecord	see Dcm382

]()

**[Dcm382]** \( \text{When responding to UDS Service 0x19 with subfunction 0x06 or 0x10 and DTCExtendedDataRecordNumber different from 0xFF or 0xFE, the DCM module shall calculate the DTCExtendedDataRecord from

Dem GetExtendedDataRecordByDTC() with the following parameter values. (BSW04010, BSW04058)

reportDTCExtendedDataRec ordByDTCNumber	reportMirrorMemoryDTCExten dedDataRecordByDTCNumber
0x06	0x10

PRIMARY_MEMORY	MIRROR_MEMORY
DTCExtendedDataRecordNum	DTCExtendedDataRecordNumb er from request
	0x06 DTCMaskRecord from request PRIMARY_MEMORY

As required in Dcm478, the DCM module shall obtain the size of the extended data record by using Dem GetSizeOfExtendedDataRecordByDTC().

### 7.4.2.5.8 UDS Service 0x19 subfunctions 0x03 – Report DTC Snapshot Record Identification

UDS Service 0x19 with subfunction 0x03 allows an external tester to request the corresponding DTCs for all FreezeFrame records present in an ECU.

[Dcm300] \( \text{ When sending a positive response to UDS Service 0x19 with subfunction 0x03, the DCM module shall use the following data in the response message:

Parameter name	Value
DTCRecord/	As defined in Dcm299
DTCSnapshotRecordNumber	

1()

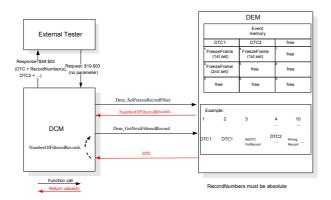

Figure 7: Request DTC Snapshot Record Identification

#### [Dcm298] The DSP submodule shall call

Dem SetFreezeFrameRecordFilter() that returns the NumberOfFilteredRecords value with DTCFormat equal to DEM DTC FORMAT UDS. (BSW04010)

[Dcm299] \tag{When responding to UDS Service 0x19 with subfunction 0x03, the DCM module shall obtain the consecutive DTCs and DTCSnapshotRecordNumbers by repeatedly calling Dem GetNextFilteredRecord(). (BSW04010)

When using paged buffer mechanism, in some case, it's possible that the number of DTC matching the filter change between the calculation of the total size, needed for the first page transmission, and the sending of the further pages. For this reason, the requirement <u>Dcm587</u> and <u>Dcm588</u> shall be considered for the implementation of this subservice.

# 7.4.2.5.9 UDS Service 0x19 subfunctions 0x04 – Report DTC Snapshot Record by DTC Number

Using UDS Service 0x19 with subfunction 0x04 an external tester can request FreezeFrame information for one or all FreezeFrames of a specific DTC. The service request contains parameters:

- DTCMaskRecord
- DTCSnapshotRecordNumber

**[Dcm302]** When sending a positive response to UDS Service 0x19 with subfunction 0x04 and DTCSnapshotRecordNumber not 0xFF, the DCM module shall use the following data in the response message:

Parameter name	Value
DTCAndStatusRecord	DTC from the request, statusOfDTC according
	to <u>Dcm383</u>
DTCSnapshotRecordNumber	The DTCSnapshotRecordNumber is contained in the output buffer from the
	Dem GetFreezeFrameDataByDTC() call.
	See Dcm384
DTCSnapshotRecordNumberOfIdentifiers/	As defined in Dcm384
DTCSnapshotRecord	

]()

[Dcm387] \[ \text{When sending a positive response to UDS Service 0x19 with subfunction \] 0x04 and DTCSnapshotRecordNumber=0xFF, the DCM module shall use the following data in the response message:

Parameter name	Value
DTCAndStatusRecord	DTC from the request, statusOfDTC according
	to <u>Dcm383</u>
DTCSnapshotRecordNumber	The DTCSnapshotRecordNumber is contained

1()

[Dcm383] \( \text{When responding to UDS Service 0x19 with subfunction 0x04, the DCM \) module shall obtain the status of the DTC by calling <code>Dem GetStatusOfDTC()</code> with the following parameters:

DTC: DTC from the request

DTCOrigin: DEM DTC ORIGIN PRIMARY MEMORY (BSW04010, BSW04058)

[Dcm384] [ Upon reception of UDS Service 0x019 with subfunction 0x04 and DTCSnapshotRecordNumber not 0xff, DCM module shall obtain the "DTCSnapshotRecordNumberOfldentifiers" and the FreezeFrame by calling Dem GetFreezeFrameDataByDTC() with the following parameter values: DTC: DTCMaskRecord from the request in UDS format

DTCOrigin: DEM DTC ORIGIN PRIMARY MEMORY

RecordNumber: DTCSnapshotRecordNumber from the request (BSW04010,

BSW04058)

[Dcm385] [ Upon reception of UDS Service 0x19 with subfunction 0x04 and DTCSnapshotRecordNumber 0xff, the DCM module shall cycle through all FreezeFrame numbers from 0x00 to 0xfe and obtain the corresponding "DTCSnapshotRecordNumberOfldentifiers" and FreezeFrame by calling Dem GetFreezeFrameDataByDTC() with the following parameter values:

DTC: DTCMaskRecord from the request in UDS format DTCOrigin: DEM DTC ORIGIN PRIMARY MEMORY

RecordNumber: value from 0x00 -> 0xFE (BSW04010, BSW04058)

[Dcm441] [ The DCM module shall obtain the size of the data returned by DEM in Dem GetFreezeFrameDataByDTC() call by using Dem GetSizeOfFreezeFrameByDTC(). (BSW04010, BSW04079)

get the size of all FreezeFrame data. the DCM module call Dem GetSizeOfFreezeFrameByDTC() with RecordNumber set to 0xFF.

# 7.4.2.5.10 UDS Service 0x19 with subfunction 0x05 (Report DTC Snapshot **Record by Record Number)**

UDS Service 0x19 with subfunction 0x05 allows an external tester to request FreezeFrame information for a specific FreezeFrame record number. The service request contains parameter:

DTCSnapshotRecordNumber

Due to DEM limitation, the diagnostic service \$19 05 is limited to the OBD legislative freeze frame.

[Dcm632] \( \text{On reception of service 0x19 with subfunction 0x05, if the record \) number of the diagnostic request is different from 0x00, the DCM module shall send a negative response with NRC 0x31 (request out of range). (()

[Dcm574] \( \text{ When sending a positive response to UDS Service 0x19 with subfunction } \) 0x05 and DTCSnapshotRecordNumber is 0x00, the DCM module shall use the following data in the response message:

Parameter name	Value
DTCSnapshotRecordNumber	DTCSnapshotRecordNumber from request (0x00)
DTCAndStatusRecord	DTC according to <a href="Dcm388">Dcm388</a> , statusOfDTC according to <a href="Dcm389">Dcm389</a>
DTCSnapshotRecordNumberOfldentifie rs / DTCSnapshotRecord	As defined in <u>Dcm388</u>

]()

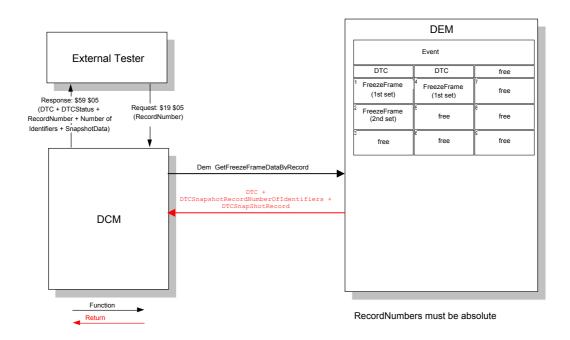

Figure 8: Request DTC Snapshot Record by Snapshot Record Number

[Dcm388] When responding to UDS Service 0x19 with subfunction 0x05 and DTCSnapshotRecordNumber is 0x00, the DCM module shall obtain the DTC, the DTCSnapshotRecordNumberOfIdentifiers and the DTCSnapshotRecord by calling Dem GetFreezeFrameDataByRecord() with the following parameter values:

RecordNumber: DTCSnapshotRecordNumber from the request (0x00)

DTCOrigin: DEM DTC ORIGIN PRIMARY MEMORY

BufSize: Data size available in the transmit buffer

DestBuffer: Address where the DEM shall copy the freeze frame data (BSW04010,

BSW04058)

[Dcm389] When responding to UDS Service 0x19 with subfunction 0x05 and DTCSnapshotRecordNumber is 0x00, the DCM module shall obtain the status of the DTC by calling Dem GetStatusOfDTC() with the following parameters:

DTC: DTC as defined in Dcm388

DTCOrigin: DEM DTC\_ORIGIN\_PRIMARY\_MEMORY\_(BSW04010, BSW04058)

The function Dem GetFreezeFrameDataByRecord() copy DTCSnapshotRecord data and DTCSnapshotRecordNumberOfldentifiers, as defined by UDS for the response message to Service 0x19 subfunction 0x05, to the buffer provided by the DCM module.

The DCM module the size of can know data returned in Dem GetFreezeFrameDataByRecord() using parameter BufSize.

### 7.4.2.5.11 UDS Service 0x19 with subfunctions

0x0B(reportFirstTestFailedDTC), 0x0C(reportFirstConfirmedDTC), 0x0D(reportMostRecentTestFailedDTC), 0x0E(reportMostRecentConfirmedDTC)

An external test tool may request an ECU to report DTCs and the associated status. matching a by the tester defined occurrence criterion, by sending a UDS Service request 0x19 including one of the following subfunctions 0x0B, 0x0C, 0x0D, 0x0E.

[Dcm392] \( \text{ When sending a positive response to UDS Service 0x19 with } \) subfunction 0x0B, 0x0C, 0x0D or 0x0E, the DCM module shall use the following data in the response message:

Parameter name	Value
DTCStatusAvailabilityMask	DTCStatusAvailabilityMask (see <a href="Dcm007">Dcm007</a> )
DTCAndStatusRecord	The DTC is obtained according to Dcm466, the
	StatusOfDtc is obtained according to Dcm393

1()

[Dcm393] For the purpose of responding to UDS Service 0x19 with subfunctions 0x0B, 0x0C, 0x0D or 0x0E, the DCM module shall obtain the StatusOfDtc by calling Dem GetStatusOfDTC() with the following parameter values:

DTC: the DTC value as defined in Dcm466

DTCOrigin: DEM DTC ORIGIN PRIMARY MEMORY (BSW04010, BSW04058)

**[Dcm466]** For the purpose of responding to UDS Service 0x19 with subfunctions 0x0B, 0x0C, 0x0D or 0x0E, the DCM shall obtain the DTC with Dem GetDTCByOccurrenceTime() using the parameter values of the following table:

	reportFirstTe stFailedDTC	reportFirstConfir medDTC	reportMostRe centTestFaile dDTC	reportMostRece ntConfirmedDTC
	0x0B	0x0C	0x0D	0x0E
DTCRequest	FIRST_	FIRST_	MOST_RECEN	MOST_REC_
	FAILED_DTC	DET_CONFIRME	T_	DET_CONFIRME
		D_DTC	FAILED_DTC	D_DTC

(BSW04010)

Dcm766 If the Dcm received DEM OCCURR NOT AVAILABLE by calling Dem GetDTCByOccurrenceTime it shall response with a positive and empty response ()

# 7.4.2.5.12 UDS Service 0x19 with subfunction 0x14(reportDTCFaultDetectionCounter)

An external test tool may request an ECU to report the FaultDetectionCounter for all DTCs with a "Prefailed" status, by sending a UDS Service request 0x19 with subfunction 0x14.

**[Dcm464]** When sending a positive response to UDS Service 0x19 with subfunction 0x14, the DCM module shall use the following data in the response message:

Parameter name	Value
DTC	The DTC is obtained according from the call to
	<pre>Dem GetNextFilteredDTCAndFDC()</pre>
DTCFaultDetectionCounter	The DTCFaultDetectionCounter is obtained according from
	the call to Dem_GetNextFilteredDTCAndFDC()

(BSW04010)

[Dcm465] \[ \text{When responding to UDS Service 0x19 with subfunctions 0x14, the DCM \] module shall obtain the DTCFaultCounter of every DTCs with status "prefailed" by repeatedly calling Dem GetNextFilteredDTCAndFDC() after having configured the filter with <code>Dem SetDTCFilter()</code> using the parameter values of the following table:

DTCStatusMask	0x00
DTCKind	DEM_DTC_GROUP_ALL_DTCS
DTCFormat	DEM_DTC_FORMAT_UDS
DTCOrigin	PRIMARY_MEMORY
FilterWithSeverity	NO
DTCSeverityMask	Not relevant
FilterForFaultDetectionCounter	YES

(BSW04010, BSW04058)

[Dcm681] The DCM module shall obtain the number of records that will be found using Dem GetNextFilteredDTCAndFDC() by using Dem GetNumberOfFilteredDTC().()

[Dcm519] The calls to Dem SetDTCFilter() with parameter FilterForFaultDetectionCounter set to YES shall be done in the context of the Dcm MainFunction() (BSW04010)

This allows the implementation to calculate the total size of the response before cycling through the DTCs.

When using paged buffer mechanism, in some case, it's possible that the number of DTC matching the filter change between the calculation of the total size, needed for the first page transmission, and the sending of the further pages. For this reason, the requirement Dcm587 and Dcm588 shall be considered for the implementation of this subservice.

# 7.4.2.6 UDS Service 0x22 - ReadDataByldentifier

[Dcm253] The DCM module shall implement the UDS Service ReadDataByldentifier (0x22)<sub>1</sub>()

With UDS Service 0x22, the tester can request the value of one or more DIDs.

[Dcm438] \( \text{On reception of the UDS Service ReadDataByIdentifier (0x22) ) with DID in the range 0x00FF to 0xF1FF or 0xF400 to 0xFEFF, for every requested DID the DCM module shall check if the DID is supported (see configuration parameter **DcmDspDid** and **DcmDspDidRange**) If none of the requested DIDs is supported.

the DCM module shall send NRC 0x31 (Reguest out of range). (()

[Dcm651] \( \text{On reception of the UDS Service ReadDataByldentifier (0x22) with DID in the range 0xF200 to 0xF3FF, the DCM module shall check if the DID has been dynamically configured. If not, the DCM module shall send NRC 0x31 (Request out of range). ()

[Dcm652] \( \text{On reception of the UDS Service ReadDataByldentifier (0x22) with DID in the range 0xF200 to 0xF3FF, if verification has been successfully done (see Dcm651) and the dynamic DID has been defined with a DID source (See Dcm646). the DCM module shall use the configuration of this DID source to read the data. ()

[Dcm653] \( \text{On reception of the UDS Service ReadDataByldentifier (0x22) with DID in the range 0xF200 to 0xF3FF, if verification has been successfully done (see Dcm651) and the dynamic DID has been defined with a memory address (See Dcm646), the DCM module shall use the callout Dcm ReadMemory to read the data. ₁()

[Dcm561] [ If a DID is set as unused (DcmDspDidUsed set to FALSE), the DCM shall consider the DID as not supported (according to Dcm438) ()

[Dcm433] \( \text{On reception of the UDS Service ReadDataByldentifier (0x22), for every requested DID the DCM module shall check if the DID has a Read access configured (see configuration parameter *DcmDspDidRead* in *DcmDspDidAccess*). If none of the DID has a Read access, the DCM module shall send NRC 0x31 (Request out of range). ()

[Dcm434] \( \text{On reception of the UDS Service ReadDataByldentifier (0x22), for every requested DID the DCM module shall check if the DID can be read in the current session (see configuration parameter *DcmDspDidReadSessionRef*). If none of the DID can be renden in the current session, the DCM module shall send a NRC 0x31 (Request out of Range). ()

[Dcm435] \( \text{On reception of the UDS Service ReadDataByIdentifier (0x22), for every requested DID the DCM module shall check if the DID can be read in the current security level (see configuration parameter *DcmDspDidReadSecurityLevelRef*). If not, the DCM module shall send NRC 0x33 (Security access denied). (()

**Dcm819** ☐ On reception of the UDS Service ReadDataByldentifier (0x22), for every requested DID the DCM module shall check if the DID can be read in the current mode condition (according to the configuration parameter **DcmDspDidReadModeRuleRef**). If not, the DCM module shall send the calculated negative response of the referenced DcmModeRule. ()

[Dcm440] [ If the requested DID references several other DID (see configuration parameter **DcmDspDidRef**), the DCM module shall process the verification and the reading of every referenced DID. ()

#### 7.4.2.6.1 Non-OBD DID

[Dcm578] On reception of the UDS Service ReadDataByldentifier (0x22), for every requested DID outside the OBD range (F400-F8FF), after all verification (see Dcm433, Dcm434 and Dcm435), If the data is configured as a "ECU signal" of the IoHwAb (parameter DcmDspDataUsePort), the DCM shall call the Api IoHwAb Dcm Read <symbolic name of ECU signal (parameter DcmDspDataReadEcuSignal)>() to get the Data. In this case, the requirements Dcm439, Dcm436 and Dcm437 shall not apply. ()

[Dcm439] \( \text{On reception of the UDS Service ReadDataByldentifier (0x22), for every requested DID outside the OBD range (F400-F8FF), the DCM module shall request the application if the DID can be read by calling the configured function (if parameter DcmDspDataUsePort set to USE DATA SYNCH FNC or USE DATA ASYNCH FNC; see configuration parameter **DcmDspDataConditionCheckReadFnc**) on each data of the DID or call the associated ConditionCheckRead operation (if parameter **DcmDspDataUsePort** set to USE\_DATA\_SYNCH\_CLIENT SERVER or USE DATA ASYNCH CLIENT SERVER). If not (one function returns E NOT OK) , the DCM module shall send a negative response with NRC set to value from the parameter "ErrorCode" of *DcmDspDataConditionCheckReadFnc* function or ConditionCheckRead operation. ()

[Dcm436] \( \text{On reception of the UDS Service ReadDataByldentifier (0x22), for every requested DID outside the OBD range (F400-F8FF), the DCM module shall check if the datas of the DID have a fixed data length (see configuration parameter **DcmDspDataFixedLength**): if not (Parameter set to False) the DCM module shall call the configured function (if parameter **DcmDspDataUsePort** set to USE DATA SYNCH FNC or USE DATA ASYNCH FNC; see configuration parameter **DcmDspDataReadDataLengthFnc**) to get the data length or call the associated ReadDataLength operation (if parameter **DcmDspDataUsePort** set to USE\_DATA\_SYNCH\_CLIENT\_SERVER or USE\_DATA\_ASYNCH\_CLIENT\_SERVER). ()

[Dcm437] \( \text{ After all verification (see \( \text{Dcm433}, \text{Dcm434}, \text{Dcm435} \) and \( \text{Dcm436} \) the DCM module shall get for every requested DID outside the OBD range (F400-F8FF), all the data values by calling all the configured function (if parameter **DcmDspDataUsePort** set to USE DATA SYNCH FNC or USE DATA ASYNCH FNC; see configuration parameter *DcmDspDataReadFnc*) or call all the associated ReadData operations (if parameter **DcmDspDataUsePort** set to USE\_DATA\_SYNCH\_CLIENT\_SERVER or USE DATA ASYNCH CLIENT SERVER) or read all the associated SenderReceiver interfaces (if parameter DcmDspDataUsePort set to USE DATA SENDER RECEIVER). ()

[Dcm560] [ If the data is configured as a BlockId of the NvRam (parameter DcmDspDataUsePort), the DCM shall call the Api NvM ReadBlock() with the BlockId (parameter DcmDspDataBlockIdRef) ()

[Dcm638] To support the required AUTOSAR data types (signed- and unsigned integer), if configuration parameter DcmDslProtocolEndiannessConvEnabled is set to TRUE, the DCM module must perform endianness conversion of all integer types for data transmitted in ReadDataByldentifier response. (when sender/receiver interface DataServices <Data> is used and reading from IoHwAb). ()

#### 7.4.2.6.2 **OBD DID**

[Dcm481] \( \text{On reception of the UDS Service ReadDataByldentifier (0x22), for every requested DID inside the OBD range (F400-F4FF), the DCM module shall get the DID value as defined for OBD Service \$01 (See Dcm407, Dcm408) ()

[Dcm482] \( \text{On reception of the UDS Service ReadDataByldentifier (0x22), for every requested DID inside the OBD Monitor range (F600-F6FF), the DCM module shall get the DID value as defined for OBD Service \$06 (See Dcm415, Dcm416) ()

[Dcm483] \( \text{On reception of the UDS Service ReadDataByldentifier (0x22), for every requested DID inside the OBD InfoType range (F800-F8FF), the DCM module shall get the DID value as defined for OBD Service \$09 (See Dcm422, Dcm423) ()

## 7.4.2.7 UDS Service 0x24 - ReadScalingDataByldentifier

[Dcm258] The DCM module shall implement the UDS Service ReadScalingDataByIdentifier (0x24) ()

To obtain scaling information, the tester can invoke UDS Service 0x24 with the 2-byte DID as parameter.

The configuration of the DCM contains for each configured DID:

- The 2-byte DID (see configuration parameter **DcmDspDidIdentifier**)
- For every data of the DID :
  - The function GetScalingInformation (see configuration **DcmDspDataGetScalingInfoFnc** and **DcmDspDataUsePort**)
  - The length of the ScalingInfo returned by the GetScalingInformation function (see configuration parameter *DcmDspDataScalingInfoSize*)

[Dcm394] \( \text{On reception of a request for UDS Service ReadScalingByldentifier, the } \) DCM module shall call every function Xxx GetScalingInformation() configured for everay data of the DID received in the request and return the data received in the response ()

### 7.4.2.8 UDS Service 0x27 - SecurityAccess

[Dcm252] The DCM module shall implement the UDS Service SecurityAccess (0x27) (BSW04005)

The purpose of this service is to provide a means to access data and/or diagnostic services, which have restricted access for security, emissions, or safety reasons.

[Dcm321] [ If the request length is correct, the DSP submodule shall check if the requested subfunction value (access type) is configured in the ECU (see configuration parameter **DcmDspSecurityLevel**). If the requested subfunction value is not configured, the DSP submodule shall trigger a negative response with NRC 0x12 (SubFunction not supported). ()

[Dcm323] [ If the requested subfunction value is configured and a service with subfunction type request seed (= odd value) has been received and if the requested access type is already active (see Dcm GetSecurityLevel()), the DSP submodule shall set the seed content to 0x00. ()

[Dcm324] \( \text{In the other case than the one described in \( \text{Dcm323} \) (access type is not active or "send key" request), the DSP submodule shall call the configured operation Xxx GetSeed() (in case "request seed" is received) or Xxx CompareKey() (in case "send key" is received). ()

The following list gives as an example, which errors can be detected by the security access service and stored in the error code information:

- RequestSequenceError (NRC 0x24), when invalid access type is send at "send kev".
- RequiredTimeDelayNotExpired (NRC 0x37), when time delay is active (see configuration parameter *DcmDspSecurityDelayTime*),
- ExeedNumberOfAttempts (NRC 0x36), when number of attempts to get security access exceeds configuration parameter (see DcmDspSecurityNumAttDelay), and
- InvalidKey (NRC 0x35), when invalid key is send at "send key".

[Dcm325] [ If no errors are detected, the DSP submodule shall set the new access type with DslInternal SetSecurityLevel().()

## 7.4.2.9 UDS Service 0x2A - ReadDataByPeriodicIdentifier

[Dcm254] The DSP submodule shall implement the UDS Service ReadDataByPeriodicIdentifier (0x2A) ()

Dcm721: On reception of the UDS Service ReadDataByPeriodicIdentifier (0x2A), for every requested periodicDID the DCM module shall check if the periodicDID can be read in the current session (see configuration parameter DcmDspDidReadSessionRef). If none of the periodicDID can be read in the current session, the DCM module shall send a NRC 0x31 (Request out of Range). (()

**Dcm722**: 「On reception of the UDS Service ReadDataByPeriodicIdentifier (0x2A), for every requested periodicDID the DCM module shall check if the periodicDID can be read in the current security level (see configuration parameter DcmDspDidReadSecurityLevelRef). If not, the DCM module shall send NRC 0x33 (Security access denied). ()

**Dcm820** [On reception of the UDS Service ReadDataByPeriodicIdentifier (0x2A), for every requested periodicDID the DCM module shall check if the periodicDID can be read in the current mode condition (see configuration parameter **DcmDspDidReadModeRuleRef**). If not, the DCM module shall send the calculated negative response code of the reference **DcmModeRule**<sub>|</sub>()

[Dcm716] To support the required AUTOSAR data types (signed- and unsigned integer), if configuration parameter DcmDslProtocolEndiannessConvEnabled is set to TRUE, the DCM module must perform endianness conversion of all integer types for data transmitted in ReadDataByPeriodicIdentifier response (when sender/receiver interface DataServices <Data> is used). ()

#### 7.4.2.10 **UDS Service 0x2C - DynamicallyDefineDataIdentifier**

[Dcm259] [ The DSP submodule shall implement the DynamicallyDefineDataIdentifier (service 0x2C, diagnostic data access) of the Unified Diagnostic Services. ()

The DvnamicallyDefineDataIdentifier service is implemented internally in DCM module.

[Dcm646] On reception of service DynamicallyDefineDataIdentifier with subservice defineByldentifier or defineByMemoryAddress, the DCM module shall configure this new DID with associated information receive from the diagnostic request: Memory address and memory length or DID source, position and size. ()

[Dcm647] \( \text{On reception of service DynamicallyDefineDataIdentifier with subservice} \) clearDynamicallyDefinedDataIdentifier, the DCM module shall remove the configuration of this DID. ()

Dcm723: 「On reception of the UDS Service DynamicallyDefineDataIdentifier (0x2C), the DCM module shall check if the DDDID can be defined in the current session (see configuration parameter *DcmDspDidWriteSessionRef*). If not, the DCM module shall send a NRC 0x31 (Request out of Range). (()

Dcm724: 「On reception of the UDS Service DynamicallyDefineDataIdentifier (0x2C), the DCM module shall check if the DDDID can be defined in the current security level (see configuration parameter **DcmDspDidWriteSecurityLevelRef**). If not, the DCM module shall send NRC 0x33 (Security access denied). ()

**Dcm725**: \( \text{On reception of the UDS Service DynamicallyDefineDataIdentifier (0x2C),}\) the DCM module shall check if the requested Source-DID or the memoryRange are supported in the current session (see configuration parameter of referenced DID or memoryRange). If not, the DCM module shall send a NRC 0x31 (Request out of Range). ()

**Dcm726**: On reception of the UDS Service DynamicallyDefineDataIdentifier (0x2C), the DCM module shall check if the requested Source-DID or the memoryRange are supported in the current security level (see configuration parameter of referenced DID or memoryRange). If not, the DCM module shall send a NRC 0x33 (Security access denied). ()

**Dcm821** FOn reception of the UDS Service DynamicallyDefineDataIdentifier (0x2C), the DCM module shall check if the requested Source-DID or the memoryRange are supported in the current mode condition (see configuration parameter of referenced DID or memoryRange). If not, the DCM module shall send the calculated negative response code of the referenced DcmModeRule. ()

In case of memory address(es), on reception of ReadDataByldentifier or ReadDataByPeriodicIdentifier request for a dynamically defined DID, the DCM will use the callout Dcm ReadMemory for all contained memory addresses to access the data.

of DID source(s). reception of ReadDataBvldentifier In case on ReadDataByPeriodicIdentifier request for a dynamically defined DID, the DCM will use the configuration of the contained DIDs to read or write the data.

#### 7.4.2.11 **UDS Service 0x2E - WriteDataByldentifier**

[Dcm255] The DCM module shall implement the UDS Service WriteDataByldentifier (0x2E) of the Unified Diagnostic Services. (1)

When using Service 0x2E, the request of the tester contains a 2-byte DID and a dataRecord with the data to be written.

The configuration of the DCM contains a list of supported DIDs and defines for each configured DID:

- The 2-byte DID (see configuration parameter **DcmDspDidIdentifier**)
- For every data of the DID:
  - The function WriteData to be used for this data (see configuration parameters **DcmDspDataWriteFnc** and **DcmDspDataUsePort**)

[Dcm467] \( \text{On reception of the UDS Service WriteDataByldentifier (0x2E) with DID} \) in the range 0x00FF to 0xF1FF, the DCM module shall check if the DID is supported (see configuration parameter **DcmDspDid** and **DcmDspDidRange**) If not, the DCM module shall send NRC 0x31 (Request out of range). ()

[Dcm562] [ If a DID is set as unused (DcmDspDidUsed set to FALSE), the DCM shall consider the DID as not supported (according to Dcm467) ()

[Dcm468] \( \text{On reception of the UDS Service WriteDataByldentifier (0x2E), the DCM module shall check if the DID has a Write access configured (see configuration parameter **DcmDspDidWrite** in **DcmDspDidAccess**). If not, the DCM module shall send NRC 0x31 (Request out of range). ()

[Dcm469] \( \text{On reception of the UDS Service WriteDataByIdentifier (0x2E), the DCM module shall check if the DID can be written in the current session (see configuration parameter **DcmDspDidWriteSessionRef**). If not, the DCM module shall send a NRC 0x31 (Request Out of Range). ()

[Dcm470] \( \text{On reception of the UDS Service WriteDataByldentifier (0x2E), the DCM module shall check if the DID can be written in the current security level (see configuration parameter *DcmDspDidWriteSecurityLevelRef*). If not, the DCM module shall send NRC 0x33 (Security access denied). ()

**Dcm822** [On reception of the UDS Service WriteDataByldentifier (0x2E), the DCM module shall check if the DID can be written in the current mode condition (see configuration parameter *DcmDspDidWriteModeRuleRef*). If not, the DCM module shall send the calculated negative response code of the referenced **DcmModeRule**.

I()[Dcm473] \( \text{On reception of the UDS Service WriteDataByldentifier (0x2E), if all

data of the DID have fixed length (See configuration parameter **DcmDspDataFixedLength**), the DCM module shall check if the received data length corresponds to the DID data length (addition of all DcmDspDataSize) ()

[Dcm395] \[ After all verification (see Dcm467, Dcm468, Dcm469, Dcm470, Dcm473 ) the DCM module shall write all the data of the DID by calling the configured functions (if parameter **DcmDspDataUsePort** set to USE DATA SYNCH FNC or USE DATA ASYNCH FNC; see configuration parameter *DcmDspDataWriteFnc*) or call all the associated *WriteData* operations (if parameter *DcmDspDataUsePort* set to USE\_DATA\_SYNCH\_CLIENT\_SERVER or USE\_DATA\_ASYNCH\_CLIENT\_SERVER) or write all the associated SenderReceiver interfaces (if parameter **DcmDspDataUsePort** set to USE DATA SENDER RECEIVER) with the following parameter values: Data: the dataRecord form the request DataLength: the number of bytes in the dataRecord (get from the configuration if the data has fixed length (See configuration parameter **DcmDspDataFixedLength**) or from the diagnostic request length if the data has dynamic length) ()

[Dcm541] [ If the data is configured as a Blockld of the NvRam (parameter DcmDspDataUsePort), the DCM shall call the Api NvM SetBlockLockStatus(), to lock the NvM Block and avoid its update by the application, and the Api NvM WriteBlock() with the Blockld (parameter DcmDspDataBlockldRef) ()

[Dcm620] The data of a DID can have dynamic datalength (See configuration parameter **DcmDspDataFixedLength**) only if this DID contains only one data. ()

In other case the DCM won't be able to split the data from the request

[Dcm639] \( \text{To support the required AUTOSAR data types (signed- and unsigned)} \) integer), if configuration parameter DcmDslProtocolEndiannessConvEnabled is set to TRUE, the DCM module must perform endianness conversion of all integer types for data received in WriteDataByldentifier response. (when sender/receiver interface DataServices <Data> is used). ()

#### **UDS Service 0x2F - InputOutputControlByIdentifier** 7.4.2.12

[Dcm256] The DCM module shall implement the UDS Service InputOutputControlByIdentifier (0x2F). ()

When using Service 0x2F, the request of the tester contains a 2-byte DID.

The configuration of the DCM contains a list of supported DID's. For each DID, the DCM configuration specifies:

- The 2-bytes DID (see configuration parameter *DcmDspDidIdentifier*)
- For every data of the DID:
  - The function Xxx ReturnControlToECU() for this (see configuration parameters **DcmDspDataReturnControlToEcuFnc** and DcmDspDataUsePort)
  - The function Xxx ResetToDefault() for this data (see configuration parameters **DcmDspDataResetToDefaultFnc** and **DcmDspDataUsePort**)
  - The function Xxx FreezeCurrentState() for this DID (see configuration parameters **DcmDspDataFreezeCurrentStateFnc** and DcmDspDataUsePort)
  - The function Xxx ShortTermAdjustment() for this DID (see configuration parameters **DcmDspDataShortTermAdjustmentFnc** and DcmDspDataUsePort)
  - The sizes of the record used function control in the Xxx ShortTermAdjustment() (see configuration parameter and DcmDspDataSize)

[Dcm579] The DCM shall support the following InputOutputControlParameter definitions:

Hex	Description
00	returnControlToECU
01	resetToDefault
02	freezeCurrentState
03	shortTermAdjustment

1()

**[Dcm563]** \( \text{On reception of the UDS Service InputOutputControlByldentifier (0x2F), the DCM module shall check if the DID is supported (see configuration parameter DcmDspDid and DcmDspDidRange) If not, the DCM module shall send NRC 0x31 (Request out of range). ()

[Dcm564] \( \text{If a DID is set as unused (DcmDspDidUsed set to FALSE), the DCM shall consider the DID as not supported (according to Dcm563) \( \text{I}() \)

[Dcm565] 「On reception of the UDS Service InputOutputControlByIdentifier (0x2F), the DCM module shall check if the DID has a Control access configured (see configuration parameter *DcmDspDidControl* in *DcmDspDidAccess*). If not, the DCM module shall send NRC 0x31 (Request out of range). 

∫()

[Dcm566] 「On reception of the UDS Service InputOutputControlByIdentifier (0x2F), the DCM module shall check if the DID can be control in the current session (see configuration parameter *DcmDspDidControlSessionRef*). If not, the DCM module shall send a NRC 0x31 (Request Out of Range). ()

[Dcm567] \( \text{On reception of the UDS Service InputOutputControlByldentifier (0x2F), the DCM module shall check if the DID can be control in the current security level (see configuration parameter \( \text{DcmDspDidControlSecurityLevelRef} \)). If not, the DCM module shall send NRC 0x33 (Security access denied). \( \text{I} \)()

**Dcm823** FOn reception of the UDS Service InputOutputControlByldentifier (0x2F), the DCM module shall check if the DID can be control in the current mode condition (see configuration parameter *DcmDspDidControlModeRuleRef*). If not, the DCM module shall send the calculated negative response code of the referenced DcmModeRule. ()

[Dcm580] \( \text{On reception of a request for UDS Service} \)

InputOutputControlByIdentifier (0x2F), if all verifications have been successfully done (see <a href="Dcm563">Dcm565</a>, <a href="Dcm565">Dcm565</a>, <a href="Dcm565">Dcm566</a>, <a href="Dcm567">Dcm567</a>) and if the data is configured as a "ECU signal" of the IoHwAb (parameter <a href="DcmDspDataUsePort">DcmDspDataUsePort</a>), the DCM shall call the Api IoHwAb\_Dcm\_<a href="Symbolic name of ECU signal (parameter DcmDspDataEcuSignal)>() with InputOutputControlParameter for the 'action' parameter and in case of InputOutputControlParameter is set to 'shortTermAdjustment' the signal value for the "signal" parameter. In this case the requirements <a href="Dcm396">Dcm396</a>, <a href="Dcm396">Dcm397</a>, <a href="Dcm398">Dcm399</a>, <a href="Dcm399">Dcm399</a>, <a href="Dcm399">Dcm399</a>,

**[Dcm581]** ☐ In case of more than one supported I/O signal per DataIdentifier, the DCM shall internally consider the parameter **controlEnableMaskRecord** and control only the included signals in the request message. ()

The controlMask information are not forwarded to the SW-Cs (DCM internal usage only).

[Dcm680] The following mapping shall be used for the controlMask management: First bit of controlMask maps to first DID data element) ()

The controlEnableMaskRecord is only present, if the DataIdentifer supports more than one signal.

### [Dcm396] \( \text{On reception of a request for UDS Service} \)

InputOutputControlByIdentifier (0x2F) with InputOutputControlParameter equal to returnControlToEcu, if all verifications have been successfully done (see Dcm563, Dcm565, Dcm566, Dcm567), the DCM module shall invoke all the configured function (if parameter **DcmDspDataUsePort** set to USE DATA SYNCH FNC or USE DATA ASYNCH FNC; see configuration parameter DcmDspDataReturnControlToEcuFnc) or call all the associated ReturnControlToECU operations (if parameter **DcmDspDataUsePort** set to USE DATA\_SYNCH\_CLIENT\_SERVER or USE DATA ASYNCH CLIENT SERVER) for every data of the DID received in the request. DcmDspDataReturnControlToEcuFnc) ()

[Dcm640] To support the required AUTOSAR data types (signed- and unsigned integer), if configuration parameter DcmDslProtocolEndiannessConvEnabled is set to TRUE, the DCM module must perform endianness conversion of all integer types for data received and transmitted in InputOutputControlByldentifier service.(when reading from IoHwAb) ()

[Dcm682] The ControlStatusRecord for the loControl response shall be retrieved using the associated ReadData operations ()

#### 7.4.2.13 **UDS Service 0x31 - RoutineControl**

[Dcm257] The DCM module shall implement the UDS Service RoutineControl (0x31) for subFunctions startRoutine, stopRoutine and requestsRoutineResults. (1)

A tester can use UDS Service 0x31 to start, stop or obtain the results of a routine identified by a 2-byte routine Identifier.

The DCM module configuration contains a list of the routineIdentifiers (see configuration parameter **DcmDspRoutineIdentifier**) supported by the DCM. each routine Identifier, the DCM configuration specifies:

The function Xxx Start() associated with this routine Identifier (see configuration parameters **DcmDspStartRoutineFnc** and DcmDspRoutineUsePort)

- List of signal available in the request and in the response (see configuration parameters *DcmDspStartRoutineIn* and *DcmDspStartRoutineOut*)
- The function Xxx\_Stop() associated with this routineIdentifier (see configuration parameters *DcmDspStopRoutineFnc* and *DcmDspRoutineUsePort*)
- List of signal available in the request and in the response (see configuration parameters *DcmDspRoutineStopIn* and *DcmDspRoutineStopOut*)
- The function Xxx\_RequestResults() associated with this routineIdentifier (see configuration parameters DcmDspRequestResultsRoutineFnc and DcmDspRoutineUsePort)
- List of signal available in the response (see configuration parameter *DcmDspRoutineRequestResOut*)

[Dcm568] \( \text{ On reception of the UDS Service RoutineControl (0x31), the DCM module shall check if the Routine is supported (see configuration parameter \( \mathbb{DcmDspRoutine} \)) If not, the DCM module shall send NRC 0x31 (Request out of range). \( \]()

[Dcm569] ☐ If a Routine is set as unused (DcmDspRoutineUsed set to FALSE), the DCM shall consider the Routine as not supported (according to Dcm568) |()

[Dcm570] \( \text{On reception of the UDS Service RoutineControl (0x31), the DCM module shall check if the Routine can be executed in the current session (see configuration parameter \( DcmDspRoutineSessionRef \)). If not, the DCM module shall send a NRC 0x31 (Request Out of Range). \( \text{I}() \)

[Dcm571] \( \text{On reception of the UDS Service RoutineControl (0x31), the DCM module shall check if the Routine can be executed in the current security level (see configuration parameter \( \text{DcmDspRoutineSecurityLevelRef} \)). If not, the DCM module shall send NRC 0x33 (Security access denied). \( \text{()} \)

**Dcm824** 「On reception of the UDS Service RoutineControl (0x31), the DCM module shall check if the Routine can be executed in the current mode condition (see configuration parameter *DcmDspRoutineModeRuleRef*). If not, the DCM module shall send the calculated negative reponse code of the referenced DcmModeRule.」()

[Dcm590] \[ \text{When receiving a request for UDS Service RoutineControl (0x31) if all verifications have been successfully done (see <a href="Dcm568">Dcm570</a>, <a href="Dcm571">Dcm571</a>), the DCM module shall split the routineControlOptionRecord received according of the list of input signal configured for this routine (See configuration parameters

**DcmDspStartRoutineIn and DcmDspRoutineStopIn**) () [Dcm400] [ When receiving a request for UDS Service RoutineControl (0x31) with subfunction startRoutine, if all verifications have been successfully done (see Dcm568, Dcm570, Dcm571), the DCM module shall call the configured Xxx Start() function passing the dataln, calculated from routineControlOptionRecord (see Dcm590), and the dataOut reference according of the list of output signal configured for this routine ( See configuration parameter **DcmDspStartRoutineOut**). The datalength of the dataIn can be fixed or dynamic according to **DcmDspRoutineFixedLength**. If dynamic, the datalength shall be provided in bits in currentDataLength parameter. The datalength can be dynamic only on the last dataln parameter. (1)

[Dcm401] [ Upon completing Dcm400, when Xxx Start() returns no ErrorCode, the DCM module shall reply with a positive response with the data returned by Xxx Start() in the dataOut as routineStatusRecord (dataOut are merged according to the list of output signal configured for this routine ( See configuration parameter **DcmDspStartRoutineOut**)). The datalength of the dataOut can be fixed or dynamic according to **DcmDspRoutineFixedLength**. If dynamic, the datalength is provided in bits in currentDataLength parameter. The datalength can be dynamic only on the last dataOut parameter. ()

[Dcm402] [ When receiving a request for UDS Service RoutineControl (0x31) with subfunction stopRoutine, if all verifications have been successfully done (see Dcm568, Dcm570, Dcm571), the DCM module shall call the configured Xxx Stop() function passing the dataln, calculated from routineControlOptionRecord (see Dcm590), and the dataOut reference according of the list of output signal configured for this routine ( See configuration parameter **DcmDspRoutineStopOut**). The datalength of the dataln can be fixed or dynamic according to **DcmDspRoutineFixedLength**. If dynamic, the datalength shall be provided in currentDataLength parameter. The datalength can be dynamic only on the last dataIn parameter. ()

[Dcm403] [ Upon completing Dcm402, when XXX Stop () returns no ErrorCode, the DCM module shall reply with a positive response with the data returned by Xxx Stop () in the dataOut as routineStatusRecord (dataOut are merged according to the list of output signal configured for this routine ( See configuration parameter **DcmDspStopRoutineOut**)). The datalength of the dataOut can be fixed or dynamic according to **DcmDspRoutineFixedLength**. If dynamic, the datalength is provided in currentDataLength parameter. The datalength can be dynamic only on the last dataOut parameter. ()

[Dcm404] When receiving a request for UDS Service RoutineControl (0x31) with subfunction requestRoutineResults, if all verifications have been successfully done (see Dcm568, Dcm570, Dcm571), the DCM module shall call the configured Xxx RequestResults () function and provide the dataOut reference according of the list of output signal configured for this routine (See configuration parameter DcmDspRoutineRequestResOut). ()

[Dcm405] [ Upon completing Dcm404, when Xxx RequestResults() returns no ErrorCode, the DCM module shall reply with a positive response with the data returned by Xxx RequestResults() in the dataOut as routineStatusRecord (dataOut are merged according to the list of output signal configured for this routine ( See configuration parameter **DcmDspRoutineRequestResOut**)). The datalength of the dataOut can be fixed or dynamic according to **DcmDspRoutineFixedLength**. If dynamic, the datalength is provided in currentDataLength parameter. The datalength can be dynamic only on the last dataOut parameter. ()

[Dcm641] To support the required AUTOSAR data types (signed- and unsigned integer), if configuration parameter DcmDslProtocolEndiannessConvEnabled is set to TRUE, the DCM module must perform endianness conversion of all integer types for data received and transmitted in RoutineControl service. ()

**[Dcm701]** ☐ On reception of the UDS Service RoutineControl (0x31), for every requested TID inside the OBD range (E000-E0FF), the DCM module shall get the TID value as defined for OBD Service \$08 (See Dcm418, Dcm419). ()

#### 7.4.2.14 **UDS Service 0x3E - Tester Present**

[Dcm251] The DCM module shall implement the Tester Present (service 0x3E, diagnostic communication and security) of the Unified Diagnostic Services for the subfunction values 0x00 and 0x80. ()

This service is used to keep one or multiple servers in a diagnostic session being different than the defaultSession.

#### **UDS Service 0x85 - ControlDTCSetting** 7.4.2.15

[Dcm249] The DCM module shall implement UDS Service ControlDTCSetting (0x85) for DTCSettingType on or off. ()

An external test tool can request an ECU to either disable or enable DTC storage in the ECUs error memory by sending a UDS Service 0x85 request with subfunction on or off.

[Dcm304] [On invocation of the sent confirmation function of the UDS Service 0x85] from DSD with DTCSettingType=on of the request, the DCM module shall call Dem EnableDTCSetting(). (BSW04010)

**Dcm783** On invocation of the sent confirmation function of the UDS Service 0x85 from DSD with DTCSettingType=on of the request (see [Dcm304), the DCM shall invoke a mode switch of the ModeDeclarationGroupPrototype DcmControlDTCSetting by calling SchM Switch DCM <vendorApiInfix> DcmControlDTCSetting (SCHM MODE DcmControlDTCSetting ENABLEDTCSETTING). ()

[Dcm406] [On invocation of the sent confirmation function of the UDS Service 0x85] from DSD with DTCSettingType=off of the request, the DCM module shall call Dem DisableDTCSetting().j(BSW04010)

**Dcm784** [On invocation of the sent confirmation function of the UDS Service 0x85] from DSD with DTCSettingType=off of the request (see Dcm304), the DCM shall invoke a mode switch of the *ModeDeclarationGroupPrototype* DcmControlDTCSetting by calling SchM Switch DCM <vendorApiInfix> DcmControlDTCSetting (SCHM MODE DcmControlDTCSetting DISABLEDTCSETTING). ()

[Dcm751] In case the DTCSetting is disabled, the DCM module shall call Dem EnableDTCSetting() and doing the mode switch of the ModeDeclarationGroupPrototype DcmControlDTCSetting to ENABLEDTCSETTING while transitioning to default session or upon any diagnostic session change where the new session do not support UDS Service ControlDTCsetting anymore. ()

For some use-cases the DCM may re-enable the controlDTCsetting due to external changed mode conditions:

[Dcm752] [Furthermore in case the DTCSetting is disabled, the DCM module shall call Dem EnableDTCSetting() and doing the mode switch of the ModeDeclarationGroupPrototype DcmControlDTCSetting to ENABLEDTCSETTING in case at least one referenced arbitrary ModeDeclarationGroupPrototypes (see configuration parameter **DcmDspControlDTCSettingReEnableModeRuleRef**) for service ControlDTCSetting (0x85) with DTCSettingType off (0x02) are not fulfilled anymore. ()

Note: This active observation of the referenced mode declaration groups can either be achieved by polling the mode condtion each MainFuntion cycle or by attaching to the change notification of mode declaration group (SchM will trigger a BSWEntitiy in DCM on changes of this mode declaration group)

#### 7.4.2.16 **UDS Service 0x3D – WriteMemoryByAddress**

[Dcm488] The DCM module shall implement the WriteMemoryByAddress (service 0x3D) of the Unified Diagnostic Services. ()

This service is used to write data using a physical memory address.

[Dcm489] \( \text{On reception of the UDS Service WriteMemoryByAddress (0x3D), the } \) DCM shall check if the complete memory range to write (from 'memoryAddress' parameter to 'memoryAddress + memorySize -1') is inside the allowed memory ranges (check of *DcmDspWriteMemoryRangeLow* and **DcmDspWriteMemoryRangeHigh** parameters for each **DcmDspWriteMemoryRangeInfo** container). If not, the DCM module shall send NRC 0x31 (Request out of range). ()

[Dcm490] [ On reception of the UDS Service WriteMemoryByAddress (0x3D), the DCM shall check if the complete memory range (from 'memoryAddress' parameter to 'memoryAddress + memorySize -1') can be written in the current security level (see **DcmDspWriteMemoryRangeSecurityLevelRef**). If security level is not correct, the DCM module shall send NRC 0x33 (securityAccessDenied). ()

**Dcm825** On reception of the UDS Service WriteMemoryByAddress (0x3D), the DCM shall check if the complete memory range (from 'memoryAddress' parameter to 'memoryAddress + memorySize -1') can be written in the current mode condition (see *DcmDspWriteMemoryRangeModeRuleRef*). If mode condition is not correct, the DCM module shall send the calculated negative response code of the referenced dcmModeRule. ()

[Dcm491] \( \text{On reception of the UDS Service WriteMemoryByAddress (0x3D), and after verification of the validity of the request (see [Dcm489 and [Dcm490) the DCM module shall call the callout Dcm\_WriteMemory().\( \)()

# 7.4.2.17 UDS Service 0x23 – ReadMemoryByAddress

[Dcm492] \( \text{ The DCM module shall implement the ReadMemoryByAddress (service 0x23) of the Unified Diagnostic Services. \( \)()

This service is used to read data using a physical memory address.

[Dcm493] 「On reception of the UDS Service ReadMemoryByAddress (0x23), the DCM shall check if the complete memory range to read (from 'memoryAddress' parameter to 'memoryAddress + memorySize -1') is inside the allowed memory ranges (check of *DcmDspReadMemoryRangeLow* and *DcmDspReadMemoryRangeHigh* parameters for each *DcmDspReadMemoryRangeInfo* container). If not, the DCM module shall send NRC 0x31 (Request out of range). ()

[Dcm494] 「On reception of the UDS Service ReadMemoryByAddress (0x23), the DCM shall check if the complete memory range (from 'memoryAddress' parameter to 'memoryAddress + memorySize -1') can be readen in the current security level (see *DcmDspReadMemoryRangeSecurityLevelRef*). If security level is not correct, the DCM module shall send NRC 0x33 (securityAccessDenied). ()

**Dcm826** Γ On reception of the UDS Service ReadMemoryByAddress (0x23), the DCM shall check if the complete memory range (from 'memoryAddress' parameter to 'memoryAddress + memorySize -1') can be readen in the current mode condition (see *DcmDspReadMemoryRangeModeRuleRef*). If mode condition is not correct, the DCM module shall send calclulated negative response code of the referenced DcmModeRule. ()

**[Dcm495]** Γ On reception of the UDS Service ReadMemoryByAddress (0x23), and after verification of the validity of the request (see **[Dcm493** and **[Dcm494**) the DCM module shall call the callout Dcm\_ReadMemory(). ()

#### UDS Service 0x34 - RequestDownload 7.4.2.18

[Dcm496] The DCM module shall implement the RequestDownload (service 0x34) of the Unified Diagnostic Services. (BSW04033)

This service is used to request the start of a download process.

#### 7.4.2.19 UDS Service 0x35 - RequestUpload

[Dcm499] The DCM module shall implement the RequestUpload (service 0x35) of the Unified Diagnostic Services. (BSW04033)

This service is used to request the start of a upload process.

#### 7.4.2.20 UDS Service 0x36 - TransferData

[Dcm502] The DCM module shall implement the TransferData (service 0x36) of the Unified Diagnostic Services. (BSW04033)

This service is used to transfer data during a download or upload process.

[Dcm503] \( \text{On reception of the UDS Service TransferData (0x36), if a download process is running (RequestDownload service has been previously received) and the request format is correct, the DCM module shall call the callout Dcm WriteMemory(). (BSW04033)

[Dcm504] \( \text{On reception of the UDS Service TransferData (0x36), if an upload \) process is running (RequestUpload service has been previously received) and the request format is correct, the DCM module shall call the callout Dcm ReadMemory(). (BSW04033)

[Dcm645] \( \text{On reception of the UDS Service TransferData (0x36), if a block \) sequence error is detected, the DCM module shall trigger a negative response with NRC 0x73 (WrongBlockSequenceCounter) ()

#### 7.4.2.21 **UDS Service 0x37 – RequestTransferExit**

[Dcm505] The DCM module shall implement the RequestTransferExit (service 0x37) of the Unified Diagnostic Services. (BSW04033)

This service is used to terminate a download or upload process.

#### 7.4.2.22 **UDS Service 0x28 – CommunicationControl**

[Dcm511] [ The DCM module shall implement the CommunicationControl (service 0x28) of the Unified Diagnostic Services. ()

[Dcm512] \( \text{On invocation of the sent confirmation function of the UDS Service} \) CommunicationControl (0x28) from DSD with the subnet parameter of the request egual to 0x00, the DCM shall do for each NetworkHandle (see DcmDspAllComMChannelRef) which is configured in

# DcmDspComControlAllChannel:

- 1) trigger the mode switch Dcm CommunicationControl <Network> ModeDeclarationGroupPrototype to the mode corresponding the communicationType and controlType parameter from the CommunicationControl request.
- 2) call the Api BswM Dcm CommunicationMode CurrentState with the parameters NetworkHandleType and Dcm CommunicationModeType corresponding to the communicationType and controlType parameter from the CommunicationControl request (see Dcm CommunicationModeType definition). ()

**Dcm785** ΓOn invocation of the sent confirmation function of the UDS Service CommunicationControl (0x28) from DSD with the subnet parameter of the request equal to 0x0F(CommunicationControl on the network which request is received on), the DCM shall do for the NetworkHandle (see

**DcmDsIProtocolRxComMChannelRef**) of the current received DcmDsIProtocolRxPduRef:

- 1) trigger the mode switch Dcm CommunicationControl <Network> ModeDeclarationGroupPrototype to the mode corresponding to the communicationType and controlType parameter from the CommunicationControl request.
- 2) call the Api BswM Dcm CommunicationMode CurrentState with the parameters NetworkHandleType and Dcm CommunicationModeType corresponding to the communicationType and controlType parameter from the CommunicationControl request (see Dcm CommunicationModeType definition) ()

**Dcm786** ΓOn invocation of the sent confirmation function of the UDS Service CommunicationControl (0x28) from DSD with the subnet parameter of the request between 0x01 and 0x0E, the DCM shall check if the received subnet parameter (see **DcmDspSubnetNumber**) is supported. In case it is not supported a NegativeResponse code 0x31 shall be sent. In case it is supported the DCM shall do for the corresponding NetworkHandle (see *DcmDspSpecificComMChannelRef*) of the received subnet parameter (see **DcmDspSubnetNumber**):

- 1) tigger the mode switche Dcm CommunicationControl <Network> ModeDeclarationGroupPrototype to the mode corresponding the communicationType and controlType parameter from the CommunicationControl request.
- 2) call the Api BswM Dcm CommunicationMode CurrentState the parameters NetworkHandleType and with Dcm CommunicationModeType corresponding the communicationType and controlType parameter from the CommunicationControl request (see Dcm CommunicationModeType definition) ()

For some use-cases the DCM may re-enable the CommunicationControl due to external changed mode conditions:

[Dcm753] The DCM module shall do for all NetworkHandles wich are currently under control (state other DCM ENABLE RX TX NORM NM) in case at least one referenced arbitrary *ModeDeclarationGroupPrototype* (see configuration parameter DcmDspComControlCommunicationReEnableModeRuleRef) is not fulfilled anymore:

- 1) trigger the mode switches of each Dcm CommunicationControl <Network> ModeDeclarationGroupPrototype to mode DCM ENABLE RX TX NORM NM
- 2) call BswM Dcm CommunicationMode CurrentState with the parameters NetworkHandleType and RequestedCommunicationMode set to DCM ENABLE RX TX NORM NM ()

#### **UDS Service 0x87 – LinkControl** 7.4.2.23

This service is used to gain bus bandwidth for diagnostic purposes

**Dcm743** The DCM module shall implement the LinkControl (service 0x87) of the Unified Diagnostic Services ()

**Dcm744** [Upon receiving a request for UDS Service 0x87, the DCM shall jump to OEM bootloader (see Dcm533) ()

It is possible to disable the jump to bootloader upon the reception of a Linkcontrol request. To do so, a vendor specific service implementation callout should be configured to manage an external processing (see chapter 8.9 External diagnostic service processing)

## 7.4.3 OBD Services

### **7.4.3.1 Overview**

The following table defines the OBD Services supported by the DCM.

Relevant OBD	Support in the DCM	
Service		
Identifier		
\$01	Supported	
\$02	Supported	
\$03	Supported	
\$04	Supported	
\$06	Supported	
\$07	Supported	
\$08	Supported	
\$09	Supported	
\$0A	Supported	

Table 5: Support for OBD services in the DCM

### 7.4.3.2 General behavior

In many cases, the DCM protocol allows the bundling of several requests (for example several "PIDs") and the corresponding bundling of the responses. The descriptions of the behavior for the individual services do not explicitly consider this. As the DCM needs to comply with OBD standard (as is defined through various

requirements below), the DCM might need to repeat the steps defined below to parse a request and assemble a valid response.

[Dcm077] \[ \text{When calling the DEM module for OBD services, the DCM module shall} \] use the following values for the parameter DTCOrigin: Service \$0A uses DEM\_DTC\_ORIGIN\_PERMANENT\_MEMORY All other services use DEM DTC ORIGIN PRIMARY MEMORY (BSW04058)

# 7.4.3.3 OBD Service \$01 - Request Current Powertrain diagnostic Data

[Dcm243] The DCM module shall implement the OBD service \$01 (Request Current Powertrain diagnostic Data) in compliance to all provisions of the OBD standard. (BSW04082, BSW04001)

Using Service \$01, an external test tool can request an emission-related ECU to return PID-values or to return the supported PIDs. OBD reserves certain PIDs for the special purpose of obtaining the list of available PIDs in a certain range. These PIDs are called "availability PIDs" and are \$00, \$20, \$40, \$60, \$80, \$A0, \$C0 an \$E0.

The DCM collects the PID information from 1 to n SW-Cs. This applies in particular for PIDs which contain several data values for potentially different sources. Example: PID\$83 reports Nox Sensor Data for sensor 1 and sensor 2 in one composed PID which might come from different SW-C.

The DCM configuration defines the PIDs that are available on the ECU. The DCM configuration defines for each such PID:

- The PID Identifier (see configuration parameter **DcmDspPidIdentifier**)
- Indication of the PID is used or not (for postbuild configuration) (see configuration parameter **DcmDspPidUsed**)
- The size of the PID (see configuration parameter **DcmDspPidSize**)
- The supported information for this PID (see configuration parameter DcmDspPidSupportInfo)
- List of data (*DcmDspPidData*) for the PID with the following configuration for every data
  - The length of the data associated with the PID (see configuration parameter **DcmDspPidDataSize**)
  - The position of the data in the PID (see configuration parameter *DcmDspPidDataPos*)
  - The reference to the supported information container (see configuration parameter **DcmDspPidDataSupportInfo**)
  - The Xxx ReadData() function that the DCM must call to obtain the current value of the data or the name of the port that the DCM uses to

obtain the current value through the RTE from a SW-C (see configuration parameters *DcmDspPidDataReadFnc* and *DcmDspPidDataUsePort*)

[Dcm407] \( \text{On reception of an OBD Service \$01 request with one or more "availability PIDs" as parameter, the DCM shall respond with the corresponding supported (=configured) PIDs encoded according to the OBD standard.\( \( \)()

To obtain the value for a PID, the DCM uses the configured Xxx\_ReadData() functions for every data of the PID.

To provide OBD Service \$01, the DCM relies on external functions that allow it to obtain the value of the PIDs. There is one such function per data of every PID that is needed by the DCM.

When using a  $Xxx_ReadData()$  function, the DCM provides a buffer of the correct length, which is filled by the function with the data PID value.

[Dcm408] \( \) On reception of an OBD Service \$01 request with one or more PIDs that are not "availability PIDs", the DCM shall obtain the current value of these PIDs by invoking the configured \( \times \times \text{ReadData}() \) functions for every data of the PID and shall return these values as response to Service \$01.\( \)()

The entity providing the actual implementation of the  $Xxx_ReadData()$  function for a specific signal of a PID might be a SW-C or another basic software module. The origin of the function is not known to the DCM but is part of the DCM configuration. Some PIDs are provided by the DEM. These PIDs are also explicitly configured in the DCM configuration and it is the responsibility of a correct DCM configuration to make the  $Xxx_ReadData()$  function point to the correct function provided by the DEM.

For certain PIDs, the DEM provides the function to obtain the PID value. Which PIDs come from the DEM are part of the DCM configuration.

The data byte A of the PIDs contain the support status of the subsequent data bytes. Since not all data values might be available due to the particular vehicle configuration (e.g. there is only a Nox-sensor 1 available in the vehicle in the example above), the PID response contains in this data byte A the information about the support status of the following data values. Note, that the PIDs always contain the same number of bytes – even if not all values are really available.

[Dcm621] \( \text{ If a PID contains support information (presence of \) \( DcmDspPidDataSupportInfo \) container) the DCM shall add the support information in the diagnostic response. \( \text{()} \)

[Dcm622] [ If a PID contains support information (presence of **DcmDspPidDataSupportInfo** container) the DCM shall calculate the support information value according to the available data for this PID: for every **DcmDspPidData** container existing for this PID, the associated support information bits, referenced in **DcmDspPidDataSupportInfo**, shall be set to one ()

The response to the OBD-tester needs to be composed out of the available data values. Data bytes that are not provided by an SW-C need to be replaced with fill-byte to obtain a complete PID contents.

[Dcm623] \( \text{When responding to OBD Service \$01, the DCM shall add fill byte in the DCM PID in order to fit to the PID size (see configuration parameter **DcmDspPidSize**) ()

[Dcm718] To support the required AUTOSAR data types (signed- and unsigned integer), if configuration parameter DcmDslProtocolEndiannessConvEnabled is set to TRUE, the DCM module must perform endianness conversion of all integer types for data received in Mode 1 response (when sender/receiver interface DataServices < Data > is used). ()

### 7.4.3.4 OBD Service \$02 – Request Power Train FreezeFrame Data

[Dcm244] The DCM shall implement OBD Service \$02 (Request Power Train FreezeFrame Data) in compliance to all provisions of the OBD standard. (BSW04082, BSW04001)

For OBD-relevant FreezeFrames AUTOSAR only supports frame 0, which is the minimum required by legislation.

[Dcm409] The DCM shall ignore all requests regarding record-numbers that are not  $0_{1}()$ 

The following sections define how specific PIDs are handled by the DCM.

## 7.4.3.4.1 OBD Service \$02 - PID\$02 - Request for the DTC of a specific FreezeFrame

An external tester can request the DTC that caused a FreezeFrame to be stored by using the Service \$02 with the PID value \$02.

[Dcm279] \( \text{On reception of a request for Service \$02 with PID \$02, the DCM shall } \) call Dem GetDTCOfOBDFreezeFrame() with FrameNumber set to 0x00 to get the DTC number (BSW04010, BSW04058)

The DEM module returns the corresponding DTC. Note that this 2-byte DTC is packed into the 4-byte data returned by the call to Dem GetDTCOfOBDFreezeFrame (). See DEM specification on how this is done.

# 7.4.3.4.2 OBD Service \$02 – availability PID – Request supported PIDs of a particular FreezeFrame

Using Service \$02, an external tester may request the supported PIDs for a specific freeze-frame by using the "availability PIDs".

[Dcm284] \( \text{On reception of a service \$02 request with an "availability PID", the DCM shall respond with the corresponding supported (=configured) PIDs encoded according to the OBD standard. (BSW04010)

# 7.4.3.4.3 OBD Service \$02 – other PIDs – Request the data records assigned to a specific PID included in a specific FreezeFrame

Using Service \$02, an external tester may request the values of specific PIDs in specific FreezeFrames.

[Dcm286] \( \text{On reception of a service \$02 request with a PID that is not an "availability PID" and is not \$02, the DCM shall call

Dem ReadDataOfOBDFreezeFrame() for every data of the PID with the following parameter values:

PID = the PID received in the OBD request

DestBuffer = a buffer in which the callee can write the value of the PID

BufSize = the size of the DestBuffer, this must be at least equal to the size needed to store the value of the PID as configured in the DCM

DataElementIndexOfPid = implicit index (from 0 to n) of the DataElement calculated by DCM according to the order of the DataElement positions in the PID (see parameter DcmDspPidDataPos) (BSW04010)

Note that is not necessary for the DCM module to lock or unlock the record updates of the DEM module.

[Dcm287] [Upon the completion of Dcm286, the DCM shall generate a response message including the respective PID, FreezeFrame Number and the associated data record for the requested FreezeFrame number. ()

# 7.4.4 OBD Service \$03 / \$07 / \$0A - Obtaining DTCs

[Dcm245] The DCM module shall implement OBD Service \$03 (Request emissionrelated diagnostic trouble codes) in compliance to all provisions of the OBD standard. (BSW04082, BSW04001)

[Dcm410] The DCM module shall implement OBD Service \$07 (Request Emission-Related Diagnostic Trouble Codes Detected during Current or Last Completed Driving Cycle) in compliance to all provisions of the OBD standard. (BSW04082, BSW04001)

[Dcm411] The DCM module shall implement OBD Service \$0A (Request Emission-Related Diagnostic Trouble Codes with Permanent Status) in compliance to all provisions of the OBD standard. (BSW04082, BSW04001)

An external test tool can request an emission-related ECU to report all stored, pending or permanent emission-related DTCs by sending the request \$03, \$07, \$0A respectively.

[Dcm289] \text{\text{ When receiving a request for OBD Service \$03, the DCM module shall} obtain from the DEM all DTCs in primary memory and with a "confirmed" status using the functions Dem SetDTCFilter() and

Dem GetNextFilteredDTC().(BSW04010)

[Dcm412] \( \text{ When receiving a request for OBD Service \$07, the DCM module shall } \) obtain from the DEM module all DTCs in primary memory with a "pending" status using the functions Dem SetDTCFilter() and

Dem GetNextFilteredDTC().(BSW04010)

[Dcm330] \text{ When receiving a request for OBD Service \$0A, the DCM module shall obtain from the DEM all DTCs stored in permanent memory using the functions Dem SetDTCFilter() and Dem GetNextFilteredDTC().(BSW04010)

The following table illustrates the parameters the DCM module must use when calling Dem SetDTCFilter() in response to a request for OBD Service \$03, \$07 or \$0A.

Parameters to Dem_SetDTCFilter					
OBD Service	\$03	\$07	\$0A		

DTCStatusMask	0x08	0x04	0x00
	(confirmed bit set)	(pending bit set)	
DTCKind	DEM_DTC_KIND_	DEM_DTC_KIND_	DEM_DTC_KIND_
	EMISSION_REL_DT	EMISSION_REL_DT	EMISSION_REL_DTC
	CS	CS	S
DTCFormat	DEM_DTC_FORMAT	DEM_DTC_FORMAT	DEM_DTC_FORMAT_
	_OBD	_OBD	OBD
DTCOrigin	DEM_DTC_ORIGIN_	DEM_DTC_ORIGIN_	DEM_DTC_ORIGIN_
	PRIMARY_MEMORY	PRIMARY_MEMORY	PERMANENT
FilterWithSeverity	DEM_FILTER_WITH	DEM_FILTER_WITH	DEM_FILTER_WITH_
	_	_	SEVERITY_NO
	SEVERITY_NO	SEVERITY_NO	
DTCSeverityMask	Not relevant	Not relevant	Not relevant
FilterForFault	DEM_FILTER_	DEM_FILTER_	DEM_FILTER_
DetectionCounter	FOR_FDC_NO	FOR_FDC_NO	FOR_FDC_NO

When using paged buffer mechanism, in some case, it's possible that the number of DTC matching the filter change between the calculation of the total size, needed for the first page transmission, and the sending of the further pages. For this reason, the requirement <u>Dcm587</u> and <u>Dcm588</u> shall be considered for the implementation of this service.

# 7.4.4.1 OBD Service \$04 – Clear/reset emission-related diagnostic information

[Dcm246] The DCM module shall implement OBD Service \$04 (Clear/reset emission-related diagnostic information) in compliance to all provisions of the OBD standard. (BSW04082, BSW04001)

An external test tool can request an emission-related ECU to clear the error memory by sending the request \$04.

[Dcm004] \text{ When receiving a request for OBD Service \$04, the DCM module shall call the operation ClearDTC with the following parameter values:

DTC = DEM\_DTC\_GROUP\_ALL\_DTCS

DTCFormat: DEM DTC FORMAT OBD

DTCOrigin = DEM DTC ORIGIN PRIMARY MEMORY (BSW04010, BSW04058, BSW04065)

[Dcm413] In case Dem ClearDTC() returns DEM CLEAR OK, the DCM module shall send a positive response. (BSW04010)

[Dcm703] In case Dem ClearDTC() returns DEM CLEAR PENDING, the DCM shall invoke Dem ClearDTC() on next Dcm MainFunction call again. It is up to the DCM to send NRC 78 to respect the response behaviour ()

[Dcm704] In case Dem ClearDTC() returns DEM CLEAR FAILED, the DCM shall send a negative response 0x22 – conditionsNotCorrect. ()

# 7.4.4.2 OBD Service \$06 - Request On-Board Monitoring Test-results for **Specific Monitored Systems**

[Dcm414] The DCM module shall implement OBD Service \$06 (Request On-Board Monitoring Test-results for Specific Monitored Systems) in compliance to all provisions of the OBD standard. (BSW04082, BSW04001)

Using Service \$06, an external test tool can request an emission-related ECU to return the DTR's associated with the OBDMID or to return the supported OBDMIDs. OBD reserves certain OBDMIDs for the special purpose of obtaining the list of supported OBDMIDs in a certain range. These OBDMIDs are called "availability OBDMIDs" and are \$00, \$20, \$40, \$60, \$80, \$A0, \$C0 an \$E0.

The DCM module's configuration defines the OBDMIDs that are available to the DCM. For each OBDMID, the configuration defines (see configuration parameter DcmDspTestResultObdmidTid):

- A list of TIDs (see configuration parameter **DcmDspTestResultObdmidTids**)
- And for each TID:
  - o The name of the port through which the DCM module has access to a (see DTRService interface configuration parameter DcmDspTestResultTid and DcmDspTestResultObdmidTid)
  - The Unit and Scaling ID to be returned with the service for the given configuration OBDMID and TID (see parameter DcmDspTestResultObdmidTidUaSid)

[Dcm415] \( \text{On reception of an OBD Service \$06 request with "availability OBDMIDs"} \) as parameter, the DCM module shall respond with the corresponding supported (=configured) OBDMIDs. ()

To provide OBD Service \$06, the DCM relies on external functions that allow it to obtain the DTR of an OBDMID/TID. There is one such function per OBDMID/TID that is needed by the DCM.

**[Dcm416]** On reception of an OBD Service \$06 request with an OBDMID that is not an "availability OBDMID", the DCM module shall run through the list of TIDs configured for the OBDMID, shall call the configured Xxx GetDTRValue() function. In case the returned Status==DCM DTRSTATUS VISIBLE, the DCM module shall assemble the response to the service call as follows:

Std./Manuf. Defined TID: TID from the configuration

Unit And Scaling ID: this is configured for the OBDMID/TID combination

Test Value (High/Low Byte): as returned from the Xxx GetDTRValue() function called for the OBDMID/TID combination

Min. Test Limit (High/Low Byte): as returned from the Xxx GetDTRValue() function called for the OBDMID/TID combination

Max. Test Limit (High/Low Byte): as returned from the Xxx GetDTRValue()

function called for the OBDMID/TID combination ()

Dcm416 implies that DTRs for which the function Xxx GetDTRValue() returns a status of DCM DTRSTATUS INVISIBLE are ignored.

When using the Xxx GetDTRValue() functions, the DCM module provides buffers in which the DTR can be stored. The actual implementation of the Xxx GetDTRValue() function for a specific OBDMID is provided by a SW-C. The origin of the function is not known to the DCM but is part of the DCM configuration.

# 7.4.4.3 OBD Service \$08 - Request Control of On-Board System, Test or Component

[Dcm417] The DCM module shall implement OBD Service \$08 (Request Control of On-Board System, Test or Component) in compliance to all provisions of the OBD standard. (BSW04082, BSW04001)

Using Service \$08, an external test tool can control an on-board system, test or component using a TID. OBD reserves certain TIDs for the special purpose of obtaining the list of supported TIDs in a certain range. These TIDs are called "availability TIDs" and are \$00, \$20, \$40, \$60, \$80, \$A0, \$C0 an \$E0.

The DCM module's configuration defines the TIDs that are available on the ECU for the purpose of OBD Service \$08. The configuration defines for each such TID (see configuration parameter **DcmDspRequestControlTestId**):

- the name of the port the DCM uses to access the RequestControlServices interface (see configuration parameter **DcmDspRequestControl**)
- the number of bytes this function takes as input (see configuration parameter DcmDspRequestControlInBufferSize)
- the number of bytes this function writes as output (see configuration parameter *DcmDspRequestControlOutBufferSize*)

To provide OBD Service \$08, the DCM relies on external functions configured per TID

[Dcm418] \( \text{On reception of an OBD Service \$08 request with one or more } \) "availability TIDs" as parameter, the DCM module shall respond with the corresponding supported (=configured) TIDs. ()

[Dcm419] \( \text{On reception of an OBD Service \$08 request with a TID that is not an "availability TID", the DCM module shall invoke the configured

Xxx RequestControl() function with the following parameters values:

InBuffer: data contained in the OBD request (the size of which must correspond to the size configured in the DCM module's configuration)

OutBuffer: space in which the RequestControl function can store its result (the size of the buffer is taken from the DCM module's configuration) ()

[Dcm420] \[ After the execution of \( \frac{Dcm419}{2} \), the Dcm module shall respond to the service request using the data stored by the RequestControl function in the OutBuffer. ()

# 7.4.4.4 OBD Service \$09 – Request Vehicle Information

[Dcm421] The DCM module shall implement OBD Service \$09 (Request Vehicle Information) in compliance to all provisions of the OBD standard. (BSW04082, BSW04001)

Using Service \$09, an external test tool can request vehicle information or can obtain lists of supported vehicle information. OBD reserves certain InfoTypes for the special purpose of obtaining the list of supported InfoTypes in a certain range. These Infotypes are called "availability InfoTypes" and are \$00, \$20, \$40, \$60, \$80, \$A0, \$C0 an \$E0.

The DCM module's configuration defines the InfoTypes and associated data that are available on one or several SW-C. The configuration defines for each such InfoType:

- The InfoType configuration parameter value of (see DcmDspVehInfoInfoType)
- For every data of the InfoType:
  - The position of this data in the InfoType (see configuration parameter DcmDspVehInfoDataOrder)
  - o the size of the value of the InfoType data (see configuration parameter DcmDspVehInfoDataSize)
  - o the function that the DCM module must call to obtain the value for this InfoType data OR the port-name through which the DCM module can obtain the value for this InfoType data (see configuration parameter DcmDspVehInfoDataReadFnc and DcmDspVehInfoDataUsePort).

To provide OBD Service \$09, the DCM relies on external functions that allow it to obtain the value of an InfoType data. There is one such function per InfoType data that is needed by the DCM.

When invoking a Xxx GetInfotypeValueData() function, the DCM module provides a buffer of the correct size in which the value of the InfoType data can be entity providing the actual implementation Xxx GetInfotypeValueData() function for a specific InfoType data might be a SW-C or another basic software module. The origin of the function is part of the DCM module's configuration.

Certain InfoTypes needed by the DCM to provide Service \$09 are provided by the DEM. This is handled in the DCM configuration.

[Dcm422] \( \text{On reception of an OBD Service \$09 request with one or more } \) "availability InfoTypes" as parameter, the DCM module shall respond with the corresponding supported (=configured) InfoTypes. ()

[Dcm423] \( \text{On reception of an OBD Service \$09 request for an InfoType that is not } \) an "availability InfoType", the DCM module shall obtain the value of this InfoType by invoking all the configured Xxx GetInfotypeValueData() function for every data of this InfoType and shall return the value as response to Service \$09 ()

[Dcm684] Additional to collecting the available InfoType value contributions from the individual SW-C, the DCM shall compute the data byte NofDataItems in the diagnostic response, which defines the number of DataItems included in one InfoType . I()

## 7.4.5 Bootloader interaction

The DCM shall be able to manage a jump to the bootloader. Due to the diversity of possibility to realize this jump, this will be done using callout call.

## 7.4.5.1 Jump to Bootloader

[Dcm531] [ A jump to bootloader is possible only with services DiagnosticSessionControl and LinkControl services (BSW04098)

[Dcm532] \( \text{On reception of service DiagnosticSessionControl if the provided session} \) is used to jump to OEM bootloader ( parameter DcmDspSessionForBoot set to DCM OEM BOOT) the DCM shall prepare the jump to the OEM bootloader (see Dcm535 and Dcm538) by triggering the mode switch of ModeDeclarationGroupPrototype DcmEcuReset to JUMPTOBOOTLOADER. (BSW04098)

Note: By this mode switch the DCM informs the BswM to prepare the jump to the bootloader.

[Dcm592] [ On reception of service DiagnosticSessionControl if the provided session is used to jump to System Supplier bootloader ( parameter DcmDspSessionForBoot set to DCM SYS BOOT) the DCM shall prepare the jump to the System Supplier bootloader (see Dcm535 and Dcm538) by triggering the mode switch of ModeDeclarationGroupPrototype DcmEcuReset to JUMPTOSYSSUPPLIERBOOTLOADER (BSW04098)

Note: By this mode switch the DCM informs the BswM to prepare the jump to the bootloader.

[Dcm533] \( \text{On reception of service LinkControl}, \text{ the DCM shall prepare the jump to} \) the OEM bootloader (see Dcm535 and Dcm538) by triggering the mode switch of ModeDeclarationGroupPrototype DcmEcuReset to JUMPTOBOOTLOADER (BSW04098)

[Dcm654] In case the *ModeDeclarationGroupPrototype* DcmEcuReset is switched to mode JUMPTOBOOTLOADER or JUMPTOSYSSUPPLIERBOOTLOADER and the configuration parameter DcmSendRespPendOnTransToBoot is set to TRUE, the DCM shall trigger transmission of NRC 0x78 - RCR-RP. In the sent confirmation of this NRC 0x78 the DCM shall trigger the mode switch of the *ModeDeclarationGroupPrototype* DcmEcuReset to EXECUTE. ()

Note: This final transmission of NRC 0x78 before switching to Bootloader shall reload the P2\* timout in the client.

[Dcm719] In case the *ModeDeclarationGroupPrototype* DcmEcuReset is switched to mode JUMPTOBOOTLOADER or JUMPTOSYSSUPPLIERBOOTLOADER the and the configuration parameter DcmSendRespPendOnTransToBoot is set to FALSE, the DCM shall shall trigger the mode switch of the *ModeDeclarationGroupPrototype* DcmEcuReset to EXECUTE in the next Dcm MainFunction cycle without sending a NRC 0x78. (1)

In case of [Dcm719, the exact response handling depends on the state of the 'suppressPosRspMsgIndicationBit' (TRUE or FALSE) in the request message.

[Dcm535] ☐ If the jump to bootloader is requested (see [Dcm532, [Dcm592 and [Dcm533) and the configuration parameter DcmSendRespPendOnTransToBoot is set to TRUE (See [Dcm654), the DCM shall call Dcm\_SetProgConditions() after confirmation of the transmission of NRC 0x78 (Response pending). (BSW04098)

This will allow to store all relevant information prior to jumping to the bootloader.

Note: It is up to the software integrator to decide where to store that data. Usually it will be stored in non-volatile memory like e.g. data flash. It is also acceptable to "store" this data in a RAM section which is not initialized out of reset.

[Dcm720] 「 If the jump to bootloader is requested (see [Dcm532, [Dcm592 and [Dcm533) and the configuration parameter DcmSendRespPendOnTransToBoot is set to FALSE (see [Dcm719), the DCM shall call Dcm\_SetProgConditions() immediately. ()

[Dcm715] 「If the jump to bootloader is requested (see [Dcm532, [Dcm592 and [Dcm533) and if the call to Dcm\_SetProgConditions() returns E\_NOT\_OK (see [Dcm535), the DCM shall not request any reset, shall not perform the jump to bootloader, and shall answer negatively to the request with NRC 0x22 (Conditions not correct). ()

[Dcm536] 「At DCM initialization (First call to Dcm\_MainFunction), the DCM shall call Dcm\_GetProgConditions() to know if the initialization is the consequence of a jump from the bootloader. (BSW04098)

Note: It is the responsibility of the software integrator to ensure that the data contained in Dcm\_ ProgConditionsType is valid when Dcm\_Init is called. E.g. if this data is stored in non-volatile memory, it may take some time to make it available after an ECU reset. This has to be taken into account when designing the ECU's startup process.

[Dcm537] If the initialization of the DCM is the consequence of a jump from the bootloader (see [Dcm536), the DCM shall call ComM\_DCM\_ActiveDiagnostic(NetworkId) to request the ComManager for the full communication mode.

**Dcm767** [When the ComM reports full communication to the Dcm, the Dcm shall

send the Response to the Service Id passed in the Dcm ProgConditionsType.

I(BSW04098)

**Dcm768** If the initialization of the DCM is the consequence of a jump from the bootloader (see **[Dcm536**) and the application is updated by an FLASH download (Dcm\_ProgConditionsType.ApplUpdated == True). The DCM shall call BswM\_Dcm\_ApplicationUpdated() to notify the BswM that the application was updated. ()

# 7.4.5.3 Flags management

On reception of a UDS Service 0x10 request (Diagnostic Session Control) with subfunction 0x02 (Start Programming Session) or UDS Service 0x87 (LinkControl), the DCM shall set the ReprogramingRequest flag and, if indicated for this service, the ResponseRequired flag.

After an ECU reset, when the flashloader is started, it will clear the ReprogramingRequest flag and - if required - send a response and clear the ResponseRequired flag.

After successful reprograming of the application software, the flashloader will set the ApplUpdated flag and, if configured, the ResponseRequired flag.

After an ECU reset, when the newly programmed application is started for the first time, the DCM shall clear the ApplUpdated flag and, if required, send a response and clear the ResponseRequired flag.

# 7.5 Error classification

This section describes how the DCM module has to treat the several error classes that may happen during the life cycle of the DCM module.

The general requirements document of AUTOSAR [1] specifies that all Basic Software modules shall distinguish (according to the product life cycle) two error types:

- Development errors: those errors shall be detected and fixed during the development phase. In most cases, those errors are software errors. The detection of errors that shall only occur during development can be switched off for production code (by static configuration namely preprocessor switches).
- Production errors: those errors are hardware errors and software exceptions that cannot be avoided and are expected to occur in production (i.e. series) code.

[Dcm012] The DCM module shall provide no Production-Errors (BSW00337)

Diagnostic-Communication-Errors are handled directly in the ISO-Protocols by NRCs.

[Dcm044] The used return values shall be the same for development and production. Only the values given by the DCM SWS shall be used. (BSW00369)

[Dcm364] Development error values are of type uint8. (BSW00327, BSW00331)

[Dcm040] The following errors and exceptions shall be detectable by the DCM module depending on its build version (development/production mode). (BSW00338)

Type or error	Relevance	Related error code	Value
Interface: Timeout occurred during interaction with another module (e.g. maximum number of response pending is reached, refer to Dcm120)	Development	DCM_E_INTERFACE_TIMEOUT	0x01
Interface return-value is out of range	Development	DCM_E_INTERFACE_RETURN_VALUE	0x02
Interface: Boundary check of buffers provided by the Dcm failed during interaction with another module (application, Dem, PduR, etc.)	Development	DCM_E_INTERFACE_BUFFER_OVERF LOW	0x03
Internal: DCM not initialized	Development	DCM_E_UNINIT	0x05
DCM API function with invalid input parameter	Development	DCM_E_PARAM	0x06
DCM API service invoked with NULL POINTER as parameter	Development	DCM_E_PARAM_POINTER	0x07

[Dcm041] [ Additional errors that are detected because of specific implementation and/or specific hardware properties shall be added in the DCM module implementation specification. The classification and enumeration shall be compatible to the errors listed above (BSW00337)

# 7.6 Error detection

[Dcm042] The detection of development errors is configurable (ON/OFF) at precompile time. The configuration parameter **DcmDevErrorDetect** shall activate or deactivate the detection of all development errors. (BSW00338, BSW00350)

[Dcm043] [ If the development error detection is enabled for this module, for every request except Dcm Init, it shall be ensured that the DCM module is already initialized. Detected errors shall be reported to the Development Error Tracer. (BSW00442, BSW00323)

[Dcm048] [ If the DcmDevErrorDetect configuration parameter is enabled, API parameter checking shall be enabled except for Dcm Init().()

#### 7.7 Error notification

[Dcm049] \[ Detected development errors shall be reported to the Det ReportError () service of the Development Error Tracer (DET) if the preprocessor switch **DcmDevErrorDetect** is set. ()

The Development Error Tracer module is just help for BSW development and integration. It must not be contained inside the production code. The API is defined, but the functionality can be chosen and implemented according to the development needs (e.g. errors count, send error information via a serial interface to an external logger, and so on).

[Dcm052] The header file of the DCM, DCM.h, shall provide a module ID called DCM MODULE ID set to the value 0x35. ()

# 7.8 Debugging

[Dcm484] [ Each variable that shall be accessible by AUTOSAR Debugging, shall be defined as global variable. (BSW00442)

[Dcm485] \[ All type definitions of variables which shall be debugged, shall beaccessible by the header file Dcm.h. (BSW00442)

[Dcm486] The declaration of variables in the header file shall be such, that it is possible to calculate the size of the variables by C-"sizeof". (BSW00442)

[Dcm487] \[ \text{Variables available for debugging shall be described in the respective} \] Basic Software Module Description (BSW00442)

[Dcm506] The current status of diagnostic activity (linked to ComM DCM InactiveDiagnostic(NetworkId) and ComM DCM ActiveDiagnostic(NetworkId) call) shall be available for debugging. (BSW00442)

[Dcm507] The current security level shall be available for debugging. (BSW00442)

[Dcm508] The current session state shall be available for debugging. (BSW00442)

**[Dcm509]** The current protocol shall be available for debugging. (BSW00442)

# 7.9 Synchronous and Asynchronous implementation

The DCM can access data using an R-Port requiring either a synchronous or an asynchronous ClientServertInterface DataServices < Data>. In the DCM SWS, the parameter DcmDspDataUsePort is set to USE DATA SYNCH CLIENT SERVER or USE DATA ASYNCH CLIENT SERVER.

In case of USE DATA SYNCH CLIENT SERVER, the interface shall be compatible Dem interface "DataServices <SyncDataElement>" (no OpStatus with the parameter).

The parameter OpStatus and return parameter E PENDING shall only be available in case of USE DATA ASYNCH CLIENT SERVER.

Note: Dcm implementation using AsynchronousServerCallPoint SynchronousServerCallPoint when calling service processors is completely an implementation decision. This only indicates that the operation uses the status of the operation to allow an asynchronous processing by the SW-C (initiating a request. checking if a request is still pending, or cancelling a pending request, see Dcm686). There is no correlation to the operation signature (i.e. existence of OpStatus parameter and E PENDING return code) that demands AsynchronousServerCallPoint or SynchronousServerCallPoint usage.

#### **DID** configuration 7.10

The configuration of the DCM contains a list of supported DIDs wich can be configured in two ways:

- The individual DID configuration, which required one port-connection per configured DID to access to the datas (reading and writing). The interface DataServices should be used for each DID in this case.
- The DID range configuration, used to handle a set of DIDs sharing the same behavior uniformly in one SW-C with only one port-connection. The interface DataServices\_DIDRange\_<Range> should be used in this case. Using this configuration allows an interface optimization.
  - The following parameters shall be configured in order to use the DIDRange optimization: *DcmDspDidRangeIdentifierLowerLimit* (see Dcm938\_Conf:) and *DcmDspDidRangeIdentifierUpperLimit* (see Dcm939\_Conf:) which delimited the range of the DIDs. *DcmDspDidRangeMaxDataLength* (see Dcm940\_Conf:) and *DcmDspDidRangeHasGaps* (see Dcm Dcm941\_Conf:)

## 8 API specification

This section defines:

- The syntax and semantics of the functions that are provided and required from other BSW modules. These take the form of "C"-APIs.
- The syntax and semantics of a subset of those functions which are used by software-components through the RTE. These take the form of descriptions using the concepts of the Software-Component Template.

# 8.1 Imported types

This section lists all types included from other modules. [Dcm333]

Γ

Module	Imported Type
ComStack_Types	BufReq_ReturnType

1()

The following types are contained in the Rte Dcm Type.h header file, which is generated by the RTE generator:

```
ImplementationDataType SecLevelType {
     LOWER-LIMIT = 0
     UPPER-LIMIT = 255
0 -> DCM SEC LEV LOCKED
1 -> DCM SEC LEV L1
3 -> Configuration dependent (up to 127)
128 -> Reserved by document (up to 254)
255 -> DCM SEC LEV ALL
};
ImplementationDataType SesCtrlType {
     LOWER-LIMIT = 1
     UPPER-LIMIT = 255
1 -> DEFAULT SESSION
2 -> PROGRAMMING SESSION
3 -> EXTENDED DIAGNOSTIC SESSION
4 -> SAFETY SYSTEM DIAGNOSTIC SESSION
5 -> Configuration dependent (up to 127)
128 -> Reserved by document (up to 254)
255 -> ALL SESSION LEVEL
};
ImplementationDataType ProtocolType {
     LOWER-LIMIT = 0
     UPPER-LIMIT = 255
0 -> DCM OBD ON CAN
1 -> DCM OBD ON FLEXRAY
2 -> DCM OBD ON IP
3 -> DCM UDS ON CAN
4 -> DCM UDS ON FLEXRAY
5 -> DCM UDS ON IP
6 -> DCM ROE ON CAN
7 -> DCM ROE ON FLEXRAY
8 -> DCM ROE ON IP
9 -> DCM PERIODICTRANS ON CAN
10 -> DCM PERIODICTRANS ON FLEXRAY
11 -> DCM PERIODICTRANS ON IP
12 -> Reserved for further AUTOSAR implementation (up to 239)
240 -> Reserved for software supplier specific implementation (up to
255)
};
ImplementationDataType NegativeResponseCodeType {
     LOWER-LIMIT = 0
     UPPER-LIMIT = 255
0x00 -> DCM E POSITIVERESPONSE
0x10 -> DCM E GENERALREJECT
0x11 -> DCM E SERVICENOTSUPPORTED
      -> DCM_E_SUBFUNCTIONNOTSUPPORTED
      -> DCM E INCORRECTMESSAGELENGTHORINVALIDFORMAT
```

```

0x8D -> DCM E TRANSMISSIONRANGENOTINGEAR
0x8F -> DCM E BRAKESWITCH NOTCLOSED
0x90 -> DCM E SHIFTERLEVERNOTINPARK
0x91 -> DCM_E_TORQUECONVERTERCLUTCHLOCKED
0x92 -> DCM E VOLTAGETOOHIGH
0x93 -> DCM E VOLTAGETOOLOW);
```

# 8.2 Type Definitions

[Dcm549] [ If, for implementation reasons, some additional types have to be defined, the Dcm module shall label these types as follows: Dcm <TypeName>Type, where <TypeName> is the name of this type adhering to the rules:

- No underscore usage
- First letter of each word upper case, consecutive letters lower case.

The Dcm module shall ensure that implementation-specific types are not "visible" outside Dcm. Otherwise. the complete architecture of corrupted. (BSW00353)

This section lists the types which are defined by the DCM SWS.

# 8.2.1 Dcm\_StatusType

Name:	Dcm_StatusType				
Туре:	uint8				
Range:	DCM_E_OK	0x0 0	This value is representing a successful operation.		
	DCM_E_COMPARE_KEY_FAILED	0x0 1	ECU compares by tester requested key with own calculated key. When comparison fails this definition is used. (used at API: RTE_DcmCompareKey() within processing of security access service)		
	DCM_E_TI_PREPARE_LIMITS	0x0 2	New timing parameters are not ok, since requested values are not within the defined limits (used at API: Dcm_PrepareSesTimingValues()).		
	DCM_E_TI_PREPARE_INCONSTENT	0x0 3	New timing parameters are not ok, since requested values are not consistent (e.g. P2min not smaller than P2max) (used at API: Dcm_PrepareSesTimingValues())		
	DCM_E_SESSION_NOT_ALLOWED	0x0 4	Application does not allow start of requested session (used at API: RTE_DcmGetSesChgPermission())		
	DCM_E_PROTOCOL_NOT_ALLOWED	0x0 5	Application does not allow start of requested protocol (used at API: RTE_DcmStartProtocol())		
	DCM_E_ROE_NOT_ACCEPTED	0x0 6	ResponseOnOneEvent request is not accepted by DCM (e.g. old ResponseOnOneEvent is not finished) (used at API: Dcm_ResponseOnOneEvent())		
	DCM_E_PERIODICID_NOT_ACCEPTE D	0x0 7	Periodic transmission request is not accepted by DCM (e.g. old Periodic transmission is not finished) (used at API: Dcm_ResponseOnOneDataByPeriodicl d ())		
	DCM_E_REQUEST_NOT_ACCEPTED	0x0 8	Application rejects diagnostic request -> (used at API: RTE_DcmIndication())		
	DCM_E_REQUEST_ENV_NOK	0x0 9	Diagnostic request is not allowed by application because of not fitting environmental conditions -> (used at API: RTE_DcmIndication())		
Description:	Base item type to transport status information.				

R4.0 Rev 3

## 8.2.2 Dcm\_SecLevelType

This type is defined in Rte\_Dcm\_Type.h header file, which is generated by the RTE generator.

Name:	Dcm_SecLevelType			
Type:	uint8			
Range:	DCM_SEC_LEV_LOCKE D	0x00		
	DCM_SEC_LEV_L1	0x01		
	configuration dependent	0x020x7F		
	Reserved by Document	0x800xFE		
	DCM_SEC_LEV_ALL	0xFF		
Description:	Security Level type definit	ion		

## 8.2.3 Dcm\_SesCtrlType

This type is defined in Rte\_Dcm\_Type.h header file, which is generated by the RTE generator.

Name:	Dcm_SesCtrlType				
Туре:	uint8				
Range:	DCM_DEFAULT_SESSION	0x01			
	DCM_PROGRAMMING_SESSION	0x02			
	DCM_EXTENDED_DIAGNOSTIC_SESSION	0x03			
	DCM_SAFETY_SYSTEM_DIAGNOSTIC_SESSIO N	0x04			
	configuration dependent	0x400x7E	(according to "diagnosticSessionType" parameter of DiagnosticSessionContro I request)		
	Reserved by Document	0x7F0xF E			
	DCM_ALL_SESSION_LEVEL	0xFF			
Description:	Session type definition				

## 8.2.4 Dcm\_ProtocolType

This type is defined in Rte\_Dcm\_Type.h header file, which is generated by the RTE generator.

Name:	Dcm_ProtocolType			
Туре:	uint8			
Range:	DCM_OBD_ON_CAN	0x00	OBD on CAN (ISO15765-4; ISO15031-5)	
	DCM_OBD_ON_FLEXRAY	0x01	(OBD on Flexray (Manufacturer specific; ISO15031-5))	
	DCM_OBD_ON_IP	0x02	(OBD on Internet Protocol (Manufacturer specific; ISO15031-5))	
	DCM_UDS_ON_CAN	0x03	UDS on CAN (ISO15765-3; ISO14229-1)	
	DCM_UDS_ON_FLEXRAY	0x04	UDS on FlexRay (Manufacturer specific; ISO14229-1)	
	DCM_UDS_ON_IP	0x05	(UDS on Internet Protocol (Manufacturer specific; ISO14229-1))	
	DCM_ROE_ON_CAN	0x06	Response On Event on CAN	
	DCM_ROE_ON_FLEXRAY	0x07	Response On Event on FlexRay	
	Reserved for further AUTOSAR implementation	0x070xE F		
	DCM_ROE_ON_IP	0x08	(Response on Event on Internet Protocol)	
	DCM_PERIODICTRANS_ON_CAN	0x09	Periodic Transmission on CAN	
	DCM_PERIODICTRANS_ON_FLEXRA Y	0x0A	Periodic Transmission on FlexRay	
	DCM_PERIODICTRANS_ON_IP	0x0B	(Periodic Transmission on Internet Protocol)	
	DCM_SUPPLIER_1	0xF0	Reserved for SW supplier specific.	
	DCM_SUPPLIER_2	0xF1	Reserved for SW supplier specific.	
	DCM_SUPPLIER_3	0xF2	Reserved for SW supplier specific.	
	DCM_SUPPLIER_4	0xF3	Reserved for SW supplier specific.	
	DCM_SUPPLIER_5	0xF4	Reserved for SW supplier specific.	
	DCM_SUPPLIER_6	0xF5	Reserved for SW supplier specific.	
	DCM_SUPPLIER_7	0xF6	Reserved for SW supplier specific.	
	DCM_SUPPLIER_8	0xF7	Reserved for SW supplier specific.	

	DCM_SUPPLIER_9	0xF8	Reserved for SW supplier specific.
	DCM_SUPPLIER_10	0xF9	Reserved for SW supplier specific.
	DCM_SUPPLIER_11	0xFA	Reserved for SW supplier specific.
	DCM_SUPPLIER_12	0xFB	Reserved for SW supplier specific.
	DCM_SUPPLIER_13	0xFC	Reserved for SW supplier specific.
	DCM_SUPPLIER_14	0xFD	Reserved for SW supplier specific.
	DCM_SUPPLIER_15	0xFE	Reserved for SW supplier specific.
Description:	Protocol type definition		

## 8.2.5 Dcm\_NegativeResponseCodeType

This type is defined in Rte\_Dcm\_Type.h header file, which is generated by the RTE generator.

Name:	Dcm_NegativeResponseCodeType			
Type:	uint8			
Range:	DCM_E_POSITIVERESPONSE	0x00	PR

For the implementation of this table a comment or a special concept is needed in the c-code because the table is not structured conform to the MISRA rules.

# 8.2.6 Dcm\_CommunicationModeType

Name:	Dcm_CommunicationModeType			
Type:	uint8			
Range:	DCM_ENABLE_RX_TX_NORM	0x00	Enable the Rx and Tx for normal communication	
	DCM_ENABLE_RX_DISABLE_TX_NORM	0x01	Enable the Rx and disable the Tx for normal communication	
	DCM_DISABLE_RX_ENABLE_TX_NORM	IUXUZ.	Disable the Rx and enable the Tx for normal communication	
	DCM_DISABLE_RX_TX_NORMAL	0x03	Disable Rx and Tx for normal communication	
	DCM_ENABLE_RX_TX_NM	0x04	Enable the Rx and Tx for network management communication	

			Enable Rx and disable the Tx for network management communication
			Disable the Rx and enable the Tx for network management communication
			Diable Rx and Tx for network management communication
			Enable Rx and Tx for normal and network management communication
	DCM_ENABLE_RX_DISABLE_TX_NORM_N M		Enable the Rx and disable the Tx for normal and network management communication
	M	Ox0 A	Disable the Rx and enable the Tx for normal and network management communication
	DCM_DISABLE_RX_TX_NORM_NM	0x0B	Disable Rx and Tx for normal and network management communication
Description:	-		

# 8.2.7 Dcm\_ConfigType

Name:	Dcm_ConfigType			
Type:	Structure			
Range:	Implementation specific			
Description:	This type defines a data structure for the post build parameters of the DCM. At initialization the DCM gets a pointer to a structure of this type to get access to its configuration data, which is necessary for initialization.			

# 8.2.8 Dcm\_ConfirmationStatusType

Name:	Dcm_ConfirmationStatusType			
Type:	uint8			
Range:	DCM_RES_POS_OK	0x00		
	DCM_RES_POS_NOT_OK	0x01		
	DCM_RES_NEG_OK	0x02		
	DCM_RES_NEG_NOT_O	0x03		

R4.0 Rev 3

	K	
Description:		

### 8.2.9 Dcm\_OpStatusType

Name:	Dcm_OpStatusType		
Type:	uint8		
Range:	DCM_INITIAL	0x0 0	Indicates the initial call to the operation
	DCM_PENDING	0x0 1	Indicates that a pending return has been done on the previous call of the operation
	DCM_CANCEL	0x0 2	Indicates that the DCM requests to cancel the pending operation
	DCM_FORCE_RCRRP_O K	0x0 3	Confirm a response pending transmission
Description:			

For the operation using the Dcm OpStatusType, the DCM shall work as follow:

[Dcm527] At first call of an operation using the Dcm OpStatusType, the DCM call the operation with OpStatus = DCM INITIAL  $_{1}$ ()

[Dcm528] [ If the value E FORCE RCRRP is returned from an operation using Dcm OpStatusType, the DCM shall invoke the transmit request for RCR-RP (NRC 0x78 transmission) and the DCM shall not realize further invocation of the operation till RCR-RP is transmitted (call to Dcm Confirmation). ()

[Dcm529] \[ After transmit confirmation of a RCR-RP transmitted on the context of [Dcm528, the DCM calls, from Dcm MainFunction (due to call context), the operation again with OpStatus = DCM FORCE RCRRP OK. ()

[Dcm530] [ If a E PENDING value is returned from an operation using the Dcm OpStatusType, the DCM call the operation on each Dcm MainFunction call with OpStatus = DCM PENDING as long as E PENDING is returned. (1)

#### 8.2.10 Dcm\_ReturnReadMemoryType

Name:	Dcm_ReturnReadMemoryType		
Type:	uint8		
Range:	DCM_READ_OK	0x0 0	Reading has been done
	DCM_READ_PENDIN G		Reading is pending, another call is request to finalize the reading
	DCM_READ_FAILED	0x0 2	Reading has failed
Description:	Return values of Callout Dcm_ReadMemory		

#### Dcm\_ReturnWriteMemoryType 8.2.11

Name:	Dcm_ReturnWriteMemoryType		
Type:	uint8		
Range:	DCM_WRITE_OK	0x0 0	Writing has been done
	DCM_WRITE_PENDIN G	0x0 1	Writing is pending, another called is requested
	DCM_WRITE_FAILED	0x0 2	The writing has failed
Description:	Return type of callout Dcm_WriteMemory		

#### 8.2.12 Dcm\_RoeStateType

Name:	Dcm_RoeStateType		
Type:	uint8		
Range:	DCM_ROE_ACTIVE	0x00	
	DCM_ROE_UNACTIV E	0x01	
Description:			

#### 8.2.13 **Dcm\_EcuStartModeType**

Name:	Dcm_EcuStartModeType		
Type:	uint8		
Range:	DCM_COLD_START 0x00 The ECU starts normally		
	DCM_WARM_STAR 0x01 The ECU starts from a bootloader jump		
Description:	Allows the DCM to know if a diagnostic response shall be sent in the case of a jump from bootloader		

#### 8.2.14 **Dcm\_ProgConditionsType**

Name:	Dcm_ProgCond	Dcm_ProgConditionsType		
Туре:	Structure			
Element:	uint8	ProtocolId	Id of the protocol on wich the request has been received	
	uint8	TesterSourceAddr	Tester source address configured per protocol	
	uint8	Sid	Service identifier of the received request	
	uint8	SubFncId	Identifier of the received subfonction	
	boolean	ReprogramingReque	st reprogramming of the ECU. HIS representation of FL_ExtProgRequestType.	
	boolean	ApplUpdated	Indicate whether the application has been updated or not. HIS representation of FL_ApplicationUpdateType.	
	boolean	ResponseRequired	Set to true in case the flashloader or application shall send a response. HIS representation of FL_ResponseRequiredType.	
Description:		Used in Dcm_SetProgConditions() to allow the integrator to store relevant information prior to jumping to bootloader.		

#### Dcm\_MsgItemType 8.2.15

Name:	Dcm_MsgItemType
Туре:	uint8
Description:	Base type for diagnostic message item

#### Dcm\_MsgType 8.2.16

Name:	Dcm_MsgType
Туре:	Dcm_MsgItemType*
Description:	Base type for diagnostic message (request, positive or negative response)

#### Dcm\_MsgLenType 8.2.17

Name:	Dcm_MsgLenType
Type:	uint32
·	Length of diagnostic message (request, positive or negative response). The maximum length is dependent of the underlying transport protocol/media.  E. g. the maximum message length for CAN Transport Layer is 4095bytes.

#### 8.2.18 Dcm\_MsgAddInfoType

Please note that the following table describes a struct type definition - including its struct items "elements".

Name:	Dcm_MsgAddInfoType		
Туре:	Structure		
Element:	bit		(Pos LSB+0) 0 = physical request 1 = functional request
	bit	suppressPoskesponse	Position LSB+1 0 = no (do not suppress) 1 = yes (no positive response will be sent)
Description:	Additional information on message request. Datastructure: Bitfield		

#### Dcm\_IdContextType 8.2.19

Name:	Dcm_IdContextType

Type:	uint8
·	This message context identifier can be used to determine the relation between request and response confirmation.

## 8.2.20 Dcm\_MsgContextType

Please note that the following table describes a struct type definition - including its struct items "elements".

Name:	Dcm_MsgContextType	Dcm_MsgContextType		
Туре:	Structure			
Element:	Dcm_MsgType	reqData	Request data, starting directly after service identifier (which is not part of this data)	
	Dcm_MsgLenType	reqDataLen	Request data length (excluding service identifier)	
	Dcm_MsgType	resData	Positive response data, starting directly after service identifier (which is not part of this data).	
	Dcm_MsgLenType	resDataLen	Positive response data length (excluding service identifier)	
	Dcm_MsgAddInfoTyp e	msgAddInfo	Additional information about service request and response (see: Dcm_MsgAddInfo)	
	Dcm_MsgLenType	resMaxDataLen	The maximal length of a response is restricted by the size of the buffer. The buffer size can depend on the diagnostic protocol identifier which is assigned to this message, e. g. an OBD protocol id can obtain other properties than the enhanced diagnostic protocol id. The resMaxDataLen is a property of the diagnostic protocol assigned by the DSL. The value does not change during communication. It cannot be implemented as a constant, because it can differ between different diagnostic protocols.	
	Dcm_IdContextType	idContext	This message context identifier can be used to determine the relation between request and response confirmation. This identifier can be stored within the application at request time, so that the response can be assigned to the original request.  Background: Within the confirmation, the message context is no more valid, all message data is lost. You need an additional information to determine the request to which this confirmation belongs.	
	PduIdType	dcmRxPduId:	Pdu identifier on which the request was received. The Pduld of the request can have consequences for message	

	processing. E. g. an OBD request will be received on the OBD Pduld and will be processed slightly different than an enhanced diagnostic request received on the physical
Description:	This data structure contains all information which is necessary to process a diagnostic message from request to response and response confirmation.

## 8.3 Function definitions

This section defines the functions provided for other modules.

[Dcm548] [ The following provides the API Naming convention for the DCM services:

- The service name format is Dcm <ServiceName>(...)
- <ServiceName>: is the name of the service primitive with first letter of each word upper case and consecutive letters lower case (BSW00310)

### 8.3.1 Functions provided for other BSW components

#### 8.3.1.1 Dcm Init

#### [Dcm037] [

Service name:	Dcm_Init
Syntax:	void Dcm_Init(     Dcm_ConfigType * ConfigPtr )
Service ID[hex]:	0x01
Sync/Async:	Synchronous
Reentrancy:	Non Reentrant
Parameters (in):	ConfigPtr
Parameters (inout):	None
Parameters (out):	None
Return value:	None
Description:	Service for basic initialization of DCM module.

(BSW00438, BSW101, BSW00358, BSW00414)

[Dcm334] [ Dcm Init() shall initialize all DCM global variables with the values of the configuration ()

The call of this service is mandatory before using the DCM module for further processing.

#### 8.3.1.2 Dcm\_GetVersionInfo

#### [Dcm065] [

Service name:	Dcm_GetVersionInfo		
Syntax:	void Dcm_GetVersionInfo( Std_VersionInfoType* versionInfo )		
Service ID[hex]:	0x24		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	None		
Parameters (inout):	None		
Parameters (out):	versionInfo Pointer to where to store the version information of this module.		
Return value:	None		
Description:	Returns the version information of this module		

」(BSW00407)

[Dcm335] \[ \text{Dcm GetVersionInfo()} \] shall return the version information of this module. The version information includes: Module Id, Vendor Id, Vendor specific version numbers (BSW00407). (BSW00374, BSW00379, BSW003, BSW00318)

[Dcm336] [ If source code for caller and callee of Dcm GetVersionInfo() is available, the DCM module shall realize Dcm GetVersionInfo() as a macro, defined in the module's header file. ()

[Dcm337] \[ Dcm GetVersionInfo() shall be pre compile time configurable On/Off by the configuration parameter **DcmVersionInfoApi**. ()

#### 8.3.1.3 Dcm\_DemTriggerOnDTCStatus

#### [Dcm614] [

Service name:	Dcm_DemTriggerOnDTCStatus		
Syntax:	Std_ReturnType Dcm_DemTriggerOnDTCStatus(     uint32 DTC,     uint8 DTCStatusOld,     uint8 DTCStatusNew )		
Service ID[hex]:	0x2B		
Sync/Async:	Synchronous		
Reentrancy:	Non Reentrant		
	DTC	This is the DTC the change trigger is assigned to.	
Parameters (in):	DTCStatusOld DTC status before change		
DTCStatusNew DTC status after change		DTC status after change	

Parameters (inout):	None
Parameters (out):	None
Return value:	Std_ReturnType E_OK: this value is always returned.
Description:	Triggers on changes of the UDS DTC status byte. Allows to trigger on ROE Event
	for subservice OnDTCStatusChanged

1()

### 8.3.2 Functions provided to BSW modules and to SW-Cs

The functions defined in this section can also be used by SW-Cs through the RTE.

```
[Dcm698] \( \text{ClientServerInterface DCMServices} \)
PossibleErrors {
                 E NOT OK = 1;
GetActiveProtocol(OUT ProtocolType ActiveProtocol, ERR{E NOT OK});
GetSesCtrlType (OUT SesCtrlType SesCtrlType, ERR{E NOT OK});
GetSecurityLevel(OUT SecLevelType SecLevel, ERR(E NOT OK));
ResetToDefaultSession(ERR{E NOT OK});
 }
]()
[Dcm699] ClientServerInterface DCM Roe
PossibleErrors {
                 E NOT OK = 1;
TriggerOnEvent(IN uint8 RoeEventId, ERR{E NOT OK});
}
]()
```

#### 8.3.2.1 Dcm\_GetSecurityLevel

#### [Dcm338] [

·			
Service name:	Dcm_GetSecurityLevel		
Syntax:	Std_ReturnType Dcm_GetSecurityLevel(     Dcm_SecLevelType* SecLevel )		
Service ID[hex]:	0x0d		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	None		
Parameters (inout):	None		
Parameters (out):		Active Security Level value Conversion formula to calculate SecurityLevel out of tester requested SecurityAccessType parameter:	

		SecurityLevel = (SecurityAccessType + 1) / 2 Content of SecurityAccessType is according to "securityAccessType" parameter of SecurityAccess request (see [11])
Return value:	Std_ReturnTyp e	E_OK: this value is always returned.
Description:	This function provides the active security level value	

」(BSW04011)

### 8.3.2.2 Dcm\_GetSesCtrlType

## [Dcm339] [

Service name:	Dcm_GetSesCtrlType		
Syntax:	Std_ReturnType Dcm_GetSesCtrlType(     Dcm_SesCtrlType* SesCtrlType )		
Service ID[hex]:	0x06		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	None		
Parameters (inout):	None		
Parameters (out):	, ,	Active Session Control Type value Content is according to "diagnosticSessionType" parameter of DiagnosticSessionControl request (see [11])	
Return value:	Std_ReturnTyp E e	E_OK: this value is always returned.	
Description:	This function provides the active session control type value.		

(BSW04011)

## 8.3.2.3 Dcm\_GetActiveProtocol

## [Dcm340] [

Service name:	Dcm_GetActiveProtocol	Dcm_GetActiveProtocol	
Syntax:	Std_ReturnType Dcm_GetActiveProtocol(     Dcm_ProtocolType* ActiveProtocol )		
Service ID[hex]:	0x0f		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	None		
Parameters (inout):	None		
Parameters (out):	ActiveProtocol Active protocol type value		
Return value:	Std_ReturnType E_OK: this value is always returned.		
Description:	This function returns the active protocol name.		

J(BSW04011)

### 8.3.2.4 Dcm\_ResetToDefaultSession

## [Dcm520] [

Service name:	Dcm_ResetToDefaultSession		
Syntax:	Std_ReturnType Dcm_ResetToDefaultSession( void )		
Service ID[hex]:	0x2a		
Sync/Async:	Synchronous		
Reentrancy:	No		
Parameters (in):	None		
Parameters (inout):	None		
Parameters (out):	None		
Return value:	Std_ReturnType E_OK: this value is always returned.		
Description:	The call to this function allows the application to reset the current session to Default session.  Example: Automatic termination of an extended diagnostic session upon exceeding of a speed limit.		

]()

## 8.3.2.5 Dcm\_TriggerOnEvent

# [Dcm521] [

Service name:	Dcm_TriggerOnEvent		
Syntax:	Std_ReturnType Dcm_TriggerOnEvent(     uint8 RoeEventId )		
Service ID[hex]:	0x2D		
Sync/Async:	Asynchronous	Asynchronous	
Reentrancy:	Reentrant		
Parameters (in):	RoeEventId	Identifier of the event that is triggered	
Parameters (inout):	None		
Parameters (out):	None		
Return value:	Std_ReturnType E_OK: RoeEventId value is valid E_NOT_OK: RoeEventId value is not valid		
Description:	The call to this function allows to trigger an event linked to a ResponseOnEvent request.  On the function call, the DCM will execute the associated service.  This function shall be called only if the associated event has been activated through a xxx_ActivateEvent() call.		

ر()ا

## 8.3.2.6 Dcm\_StopROE

#### Dcm730

Service name:	Dcm_StopROE
Syntax:	Std_ReturnType Dcm_StopROE( void

R4.0	Rev	3

Service ID[hex]:	0x2e	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
Parameters (in):	None	
Parameters (inout):	None	
Parameters (out):	None	
Return value:	Std_ReturnType E	OK: this value is always returned.
Description:	This function stops ROE and clears the ROE event from the transmission queue.	

ر)(

R4.0 Rev 3

### 8.3.2.7 Dcm RestartROE

#### Dcm731

Service name:	Dcm_RestartROE	
Syntax:	Std_ReturnType Dcm_RestartROE( void )	
Service ID[hex]:	0x2f	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
Parameters (in):	None	
Parameters (inout):	None	
Parameters (out):	None	
Return value:	Std_ReturnType E_OK: this value is always returned.	
Description:	This function restarts the ROE event.	

**」()** 

# 8.4 Callback Notifications

This section defines the functions provided for lower layer BSW modules. The function prototypes of the callback functions will be provided in the file Dcm\_Cbk.h

R4.0 Rev 3

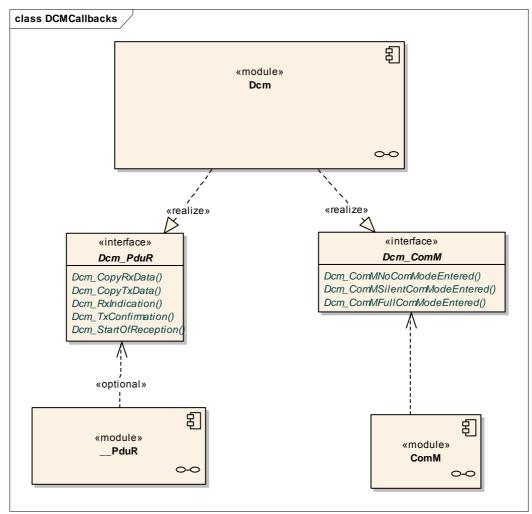

Figure 9: Overview of the callbacks provided by the DCM

# 8.4.1 Dcm\_StartOfReception

#### [Dcm094] [

Service name:	Dcm_StartOfRecepti	ion
Syntax:	BufReq_ReturnType Dcm_StartOfReception( PduIdType DcmRxPduId, PduLengthType TpSduLength, PduLengthType* RxBufferSizePtr )	
Service ID[hex]:	0x00	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	DcmRxPduld	Identifies the DCM data to be received. This information is used within the DCM to distinguish two or more receptions at the same time.
	TpSduLength	This length identifies the overall number of bytes to be received.
Parameters (inout):	None	

Parameters (out):	RxBufferSizePtr	Length of the available buffer
Return value:	BufReq_ReturnTyp e	
Description:	Called once to initialize the reception of a diagnostic request	

1()

By the function Dcm StartOfReception() the receiver (e.g. DCM) is also informed implicitly about a first frame reception or a single frame reception. If the function Dcm StartOfReception() returns a return value not equal to BUFREQ OK, the values of the out parameters are not specified and should not be evaluated by the caller.

[Dcm444] \( \text{ If the requested size is large than the buffer available in the DCM, the function Dcm StartOfReception() shall return BUFREQ E OVFL (see Dcm094). ()

**Dcm788** When processing a diagnostic request, the DCM module shall accept (Dcm StartOfReception() shall return BUFREQ E OK) any new request using a different DcmRxPduId in case *DcmDsIDiagRespOnSecondDeclinedRequest* is set to TRUE. ()

**Dcm789** In case Dcm788, the Dcm respond with a NRC 0x21<sub>1</sub>()

**Dcm790** When processing a diagnostic request, the DCM module shall reject (Dcm StartOfReception() shall return BUFREQ E NOT OK) any new request using a different DcmRxPduId in case

**DcmDsIDiagRespOnSecondDeclinedRequest** is set to FALSE until the current diagnostic request processing is over. ()

[Dcm557] \( \text{ When processing a diagnostic request, the DCM module shall reject } \) (Dcm StartOfReception() shall return BUFREQ E NOT OK) any new diagnostic request with the same DcmRxPudId until the current diagnostic request processing is over. ()

[Dcm642] [ When the API Dcm StartOfReception (or Dcm CopyRxData) is invoked with TpSduLength (or SduLength from PduInfoPtr) equal to 0, the value BUFREQ OK shall be returned and RxBufferSizePtr shall be set to the size of the Rx buffer. ()

[Dcm655] If the current session is a non-default session and a new diagnostic request with same or lower priority protocol than active one is detected, the DCM shall act according Dcm788, Dcm789 and Dcm790. ()

[Dcm656] If the current session is the default session and a diagnostic request is in execution, for any new diagnostic request with same or lower priority protocol than active one, the DCM shall act according Dcm788, Dcm789 and Dcm790. ()

## 8.4.2 Dcm\_CopyRxData

#### [Dcm556] [

Service name:	Dcm_CopyRxData	
Syntax:	BufReq_ReturnType Dcm_CopyRxData( PduIdType DcmRxPduId, PduInfoType* PduInfoPtr, PduLengthType* RxBufferSizePtr )	
Service ID[hex]:	0x02	
Sync/Async:	Synchronous	
Reentrancy:		t Pdulds. Non reentrant for the same Pduld.
	DcmRxPduld	Identifies the DCM data to be received. This information is used within the DCM to distinguish two or more receptions at the same time.
Parameters (in):	PduInfoPtr	Pointer to a PduInfoType which indicates the number of bytes to be copied (SduLength) and the location of the source data (SduDataPtr).  An SduLength of 0 is possible in order to poll the available receive buffer size. In this case no data are to be copied and PduInfoPtr might be invalid.
Parameters (inout):	None	
Parameters (out):	RxBufferSizePtr	Remaining free place in receive buffer after completion of this call.
Return value:		BUFREQ_OK: Data has been copied to the receive buffer completely as requested. BUFREQ_E_NOT_OK: Data has not been copied. Request failed.
Description:	Called once upon reception of each segment. Within this call, the received data is copied from the receive TP buffer to the DCM receive buffer.  The API might only be called with an SduLength greater 0 if the RxBufferSizePtr returned by the previous API call indicates sufficient receive buffer (SduLength ≤ RxBufferSizePtr).  The function must only be called if the connection has been accepted by an initial call to Dcm_StartOfReception.	

]()

[Dcm443] [ If Dcm StartOfReception() returns BUFREQ OK, the further call to Dcm CopyRxData() shall copy the data from the buffer provided inPduInfoPointer parameter) to the DCM buffer and update the RxBufferSizePtr parameter with remaining free place in DCM receive buffer after completion of this call. ()

[Dcm342] \( \text{ After starting to copy the received data (see \( \text{Dcm443} \)), the DCM module shall not access the receive buffer until it is notified by the service Dcm TpRxIndication() about the successful completion or unsuccessful termination of the reception. ()

## 8.4.3 Dcm\_TpRxIndication

#### [Dcm093] [

Service name:	Dcm_TpRxInd	dication
Syntax:	void Dcm_TpRxIndication( PduIdType DcmRxPduId, NotifResultType Result )	
Service ID[hex]:	0x03	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
Parameters (in):	d Result	ID of DCM I-PDU that has been received. Identifies the data that has been received.  Range: 0(maximum number of I-PDU IDs received by DCM) – 1  - NTFRSLT_OK: the complete N-PDU has been received and is stored in the receive buffer  - any other value: the N_PDU has not been received; the receive buffer can be unlocked by the DCM
Parameters (inout):	None	
Parameters (out):	None	
Return value:	None	
Description:	This is called by the PduR to indicate the competion of a reception	

]()

[Dcm344] [ If Dcm TpRxIndication() is called with parameter Result = NTFRSLT E NOT OK, then the DCM module shall not evaluate the buffer assigned to the I-PDU, which is referenced in parameter DcmTxPduId. ()

Rationale for Dcm344: It is undefined which part of the buffer contains valid data in this case

[Dcm345] [ Dcm TpRxIndication() shall be callable in interrupt context. ()

### 8.4.4 Dcm\_CopyTxData

#### [Dcm092] [

Service name:	Dcm_CopyTxData	
Syntax:	BufReq_ReturnType Dcm_CopyTxData( PduIdType DcmTxPduId, PduInfoType* PduInfoPtr, RetryInfoType* RetryInfoPtr, PduLengthType* TxDataCntPtr )	
Service ID[hex]:	0x04	
Sync/Async:	Synchronous	
Reentrancy:		t Pdulds. Non reentrant for the same Pduld.
	DcmTxPduld	Identifies the DCM data to be sent. This information is used to derive the PCI information within the transport protocol. The value has to be same as in the according service call PduR_DcmTransmit().
Parameters (in):	PduInfoPtr	Pointer to a PduInfoType, which indicates the number of bytes to be copied (SduLength) and the location where the data have to be copied to (SduDataPtr).  An SduLength of 0 is possible in order to poll the available transmit data count. In this case no data are to be copied and SduDataPtr might be invalid.
	RetryInfoPtr	If the transmitted TP I-PDU does not support the retry feature a NULL_PTR can be provided. This indicates that the copied transmit data can be removed from the buffer after it has been copied.
Parameters (inout):	None	
Parameters (out):	TxDataCntPtr	Remaining Tx data after completion of this call.
Return value:	/	BUFREQ_OK: Data has been copied to the transmit buffer completely as requested. BUFREQ_E_NOT_OK: Data has not been copied. Request failed, in case the corresponding I-PDU was stopped.
Description:	At invocation of Dcm_CopyTxData the DCM module copies the requested transmit data with ID Pduld from its internal transmit buffer to the location specified by the PduInfoPtr. The function Dcm_CopyTxData also calculates and sets the TxDataCntPtr to the amount of remaining bytes for the transmission of this data. If RetryInfoPtr is NULL_PTR or if TpDataState is not equal TP_DATARETRY, the Dcm shall always copy the next fragment of data to the SduDataPtr. If TpDataState equals TP_DATARETRY, the Dcm shall copy previously copied data again, beginning from the offset position given in RetryInfoPtr->TxTpDataCnt	

]()

If the copied data is smaller than the length requested to transmit within the service PduR DcmTransmit() the DCM module will be requested by the service Dcm CopyTxData() to provide another data when the current copied data have been transmitted.

[Dcm346] [ If the function Dcm CopyTxData() is called and the DCM module successfully copy the data in the buffer provided in PduInfoPtr parameter, then the the function shall return BUFREQ OK. ()

[Dcm349] \[ After starting to copy the received data (see \( \text{Dcm346} \)), the DCM module shall not access this buffer unless it is requested to provide a new buffer with service Dcm CopyTxData() for the same DcmTxPduld or it is notified about the successful transmission (Call of service Dcm TpTxConfirmation()) or it is notified by an error indicating that the transmission was aborted (Call of service

Dcm TpTxConfirmation()).()

[Dcm350] [ Caveats of Dcm CopyTxData():

- The value of parameter Length of function Dcm CopyTxData() shall not exceed the number of Bytes still to be sent.
- If this service returns BUFREQ E NOT OK the transmit requests issued by calling the service PduR DcmTransmit() is still not finished. A final confirmation (indicating an error with call of service Dcm TpTxConfirmation()) is required to finish this service and to be able to start another transmission (call to PduR DcmTransmit()). So it is up to the transport protocol to confirm the abort of transmission.
- The value of parameter DcmTxPduld in a call of Dcm CopyTxData() has to be same as in the according service call PduR DcmTransmit().()

## 8.4.5 Dcm TpTxConfirmation

#### [Dcm351] [

Service name:	Dcm_TpTxConfirmation		
Syntax:	void Dcm_TpTxConfirmation( PduIdType DcmTxPduId, NotifResultType Result )		
Service ID[hex]:	0x05		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
	DcmTxPdul ID of DCM I-PDU that has been transmitted. Range: 0(maximum number of I-PDU IDs transmitted by DCM) – 1  Result - NTFRSLT_OK if the complete N-PDU has been transmitted NTFRSLT_E_CANCELATION_OK if the N-PDU has been successfully cancelled - NTFRSLT_E_CANCELATION_NOT_OK if an error occurred when cancelling the N-PDU - any other value: an error occurred during transmission, the DCM can unlock the transmit buffer		
Parameters (inout):	None		
Parameters (out):	None		

Return value:	None
Description:	This is called by the PduR to confirm a Transmit

]()

[Dcm352] [ If the function Dcm TpTxConfirmation() is called, then the DCM module shall unlock the transmit buffer. ()

[Dcm353] [ If the function Dcm TpTxConfirmation() is called, then the DCM module shall stop error handling (Page buffer timeout, P2ServerMax/P2\*ServerMax timeout ). ()

[Dcm354] [ Dcm TpTxConfirmation() shall be callable in interrupt context (e.g. from a transmit interrupt) ()

For transmission via FlexRay the following restriction has to be considered: Since the FlexRay Specification does not mandate the existence of a transmit interrupt, the exact meaning of this confirmation (i.e. "transfer into the FlexRay controller's send buffer" OR "transmission onto the FlexRay network") depends on the capabilities of the FlexRay communication controller and the configuration of the FlexRay Interface.

## 8.4.6 Dcm ComM NoComModeEntered

#### [Dcm356] [

Service name:	Dcm_ComM_NoComModeEntered		
Syntax:	void Dcm_ComM_NoComModeEntered( uint8 NetworkId )		
Service ID[hex]:	0x21		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	NetworkId Identifier of the network concerned by the mode change		
Parameters (inout):	None		
Parameters (out):	None		
Return value:	None		
Description:	This call informs the Dcm module about a ComM mode change to COMM_NO_COMMUNICATION.		

]()

[Dcm148] [ Dcm ComM NoComModeEntered() shall disable all kinds of transmissions (receive and transmit) of communication. This means that the message reception and also the message transmission shall be off. ()

[Dcm149] 「 Dcm ComM NoComModeEntered() shall disable the ResponseOnEvent transmissions. ()

[Dcm150] [ Dcm ComM NoComModeEntered() shall disable the periodicld transmissions (ReadDataByPeriodicIdentifier). ()

[Dcm151] [ Dcm ComM NoComModeEntered() shall disable normal transmissions. ()

[Dcm152] [ After Dcm ComM NoComModeEntered() has been called, the DCM module shall not call the function PduR DcmTransmit().j()

## 8.4.7 Dcm ComM\_SilentComModeEntered

#### [Dcm358] [

Service name:	Dcm_ComM_SilentComModeEntered		
Syntax:	void Dcm_ComM_SilentComModeEntered(     uint8 NetworkId )		
Service ID[hex]:	0x22		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	NetworkId	Identifier of the network concerned by the mode change	
Parameters (inout):	None		
Parameters (out):	None		
Return value:	None		
Description:	This call informs the Dcm module about a ComM mode change to COMM_SILENT_COMMUNICATION.		

]()

[Dcm153] [ Dcm ComM SilentComModeEntered() shall disable all transmission.

This means that the message transmission shall be off. ()

[Dcm154] [ Dcm ComM SilentComModeEntered() shall disable the ResponseOnEvent transmissions. ()

[Dcm155] [ Dcm ComM SilentComModeEntered() shall disable the periodicId transmissions (ReadDataByPeriodicIdentifier) shall be disabled. (1)

[Dcm156] 「 Dcm ComM SilentComModeEntered() shall disable the normal transmissions. ()

## 8.4.8 Dcm ComM FullComModeEntered

#### [Dcm360] [

Service name:	Dcm_ComM_FullComModeEntered		
Syntax:	void Dcm_ComM_FullComModeEntered(     uint8 NetworkId )		
Service ID[hex]:	0x23		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	Networkld	Identifier of the network concerned by the mode change	
Parameters (inout):	None		
Parameters (out):	None		
Return value:	None		
Description:	This call informs the Dcm module about a ComM mode change to COMM_FULL_COMMUNICATION.		

1()

[Dcm157] 「 Dcm ComM FullComModeEntered() shall enable all kind of communication. This means that the message reception and also the message transmission shall be on. ()

[Dcm159] [ Dcm ComM FullComModeEntered() shall enable the ResponseOnEvent transmissions. ()

[Dcm160] [ Dcm ComM FullComModeEntered() shall enable the periodicId transmissions (ReadDataByPeriodicIdentifier). ()

[Dcm161] [ Dcm ComM FullComModeEntered() shall enable the normal transmissions. ()

[Dcm162] [ After Dcm ComM FullComModeEntered() has been called, the DCM shall handle the functions DslInternal ResponseOnOneDataByPeriodicId() or DslInternal ResponseOnOneEvent() without restrictions. ()

### 8.5 Callout Definitions

Callouts are pieces of code that have to be added to the DCM during ECU integration. The content of most callouts is hand-written code, for some callouts the DCM configuration tool shall generate a default implementation that is manually edited by the integrator. Conceptually, these callouts belong to the ECU Firmware.

Since callouts are no services of the DCM they do not have an assigned Service ID.

The Autosar architecture doesn't provide the possibility to access the ECU memory using a physical address. This realized using BlockId wich identified a memory block. According to that, the DCM is not able to fully support the implementation of ISO14229-1 services wich request a physical memory access.

Therefore, the DCM define callout to realize this kind of memory access.

This callout implementation could be simply realized by defining a mapping between the Blockld and the physical memory address.

## 8.5.1 Dcm\_ReadMemory

### [Dcm539]

Service name:	Dcm_ReadMemory		
Syntax:	Dcm_ReturnReadMemoryType Dcm_ReadMemory(     Dcm_OpStatusType OpStatus,     uint8 MemoryIdentifier,     uint32 MemoryAddress,     uint32 MemorySize,     uint8* MemoryData )		
Service ID[hex]:	0x26		
Sync/Async:	Asynchronous		
Reentrancy:	Non Reentrant		
Danasa dana (in)	OpStatus	DCM_INITIAL: All In-parameters are valid DCM_PENDING: All In-parameters are set to 0x0 DCM_CANCEL: All In-parameters are set to 0x0 DCM_FORCE_RCRRP_OK: All In-parameters are set to 0x0	
Parameters (in):	Memoryldentifier	Identifier of the Memory Block (e.g. used if memory section distinguishing is needed) Note: If it's not used this parameter shall be set to 0.	
	MemoryAddress	Starting address of server memory from which data is to be retrieved.	
	MemorySize	Number of bytes in the MemoryData	
Parameters (inout):	None		
Parameters (out):	MemoryData	Data read (Points to the diagnostic buffer in DCM)	
Return value:	Dcm_ReturnReadMemoryType	DCM_READ_OK: read was successful	

ΔU	) <b>5\D</b>	R

DCM_READ_FAILED: read was not successful DCM_READ_PENDING: read is not yet finished	
The Dcm_ReadMemory callout is used to request memory data identified by the parameter memoryAddress and memorySize from the UDS request message.  This service is needed for the implementation of UDS services:  - ReadMemoryByAdress  - RequestUpload  - ReadDataByIdentifier (in case of Dynamical DID defined by memory address)	

١()

[Dcm644] \( \text{If the call to Dcm\_ReadMemory returns DCM\_READ\_FAILED, the DCM module shall trigger a negative response with NRC 0x72 (GeneralProgrammingFailure). \( \)()

# 8.5.2 Dcm\_ WriteMemory

## [Dcm540] [

Service name:	Dcm_WriteMemory		
Syntax:	Dcm_ReturnWriteMemoryType Dcm_WriteMemory(     Dcm_OpStatusType OpStatus,     uint8 MemoryIdentifier,     uint32 MemoryAddress,     uint32 MemorySize,     uint8* MemoryData )		
Service ID[hex]:	0x27		
Sync/Async:	Asynchronous		
Reentrancy:	Non Reentrant		
Parameters (in):	OpStatus	DCM_INITIAL: All In-parameters are valid DCM_PENDING: All In-parameters are set to 0x0 DCM_CANCEL: All In-parameters are set to 0x0 DCM_FORCE_RCRRP_OK: All In-parameters are set to 0x0	
	Memoryldentifier	Identifier of the Memory Block (e.g. used by WriteDataByIdentifier service). Note: If it's not used this parameter shall be set to 0.	
	MemoryAddress	Starting address of server memory in which data is to be copied. Note: If it's not used (e.g. if the data is compressed) this parameter shall be set to 0.	
	MemorySize	Number of bytes in MemoryData	
	MemoryData	Data to write (Points to the diagnostic buffer in DCM)	
Parameters (inout):	None		
Parameters (out):	None		
Return value:	Dcm_ReturnWriteMemoryTyp e	DCM_WRITE_OK: write was successful DCM_WRITE_FAILED: write was not successful DCM_WRITE_PENDING: write is not yet finished	

	R4.0 Rev
Description:	The Dcm_WriteMemory callout is used to write memory data identified by the parameter memoryAddress and memorySize. This service is needed for the implementation of UDS services:  - WriteMemoryByAdress

RequestDownload

]()

Note:

# The callout implementation shall take care of the following points :

- When writing data in NVRAM, take care to keep the consistency with data in the mirror RAM

WriteDataByldentifier (in case of Dynamical DID defined by memory address)

- When writing data in memory, take care that a SW-C won't overwrite the data. Maybe the SW-C should be informed of this writing

[Dcm643] [ If the call to Dcm\_WriteMemory returns DCM\_WRITE\_FAILED, the DCM module shall trigger a negative response with NRC 0x72 (GeneralProgrammingFailure). |()

# 8.5.3 Dcm\_Confirmation

#### [Dcm547] [

Service name:	Dcm_Confirr	nation	
Syntax:	void Dcm_Confirmation(     Dcm_IdContextType idContext,     PduIdType dcmRxPduId,     Dcm_ConfirmationStatusType status )		
Service ID[hex]:	0x29		
Sync/Async:	Synchronous	3	
Reentrancy:	No		
Parameters (in):	dcmRxPdul d status	Current context identifier which can be used to retrieve the relation between request and confirmation. Within the confirmation, the Dcm_MsgContext is no more available, so the idContext can be used to represent this relation. The idContext is also part of the Dcm_MsgContext  DcmRxPduld on which the request was received. The source of the request can have consequences for message processing.  Status indication about confirmation (differentiate failure indication and normal confirmation) / The parameter "Result" of "Dcm_TxConfirmation" shall be forwarded to status depending if a positive or negative responses was sent before.	
Parameters (inout):	None		
Parameters (out):	None		
Return value:	None		
Description:	This function confirms thesuccessful transmission or a transmission error of a diagnostic service. The idContext and the dcmRxPduId are required to identify the message which was processed.		

J(BSW04019)

# 8.5.4 Dcm\_SetProgConditions

# [Dcm543] [

Service name:	Dcm SetProgCondi	tions	
Syntax:	Std_ReturnType Dcm_SetProgConditions(     Dcm_ProgConditionsType * ProgConditions )		
Service ID[hex]:	-		
Sync/Async:	Asynchronous		
Reentrancy:	Non Reentrant		
Parameters (in):		Conditions on which the jump to bootloader has been requested	
Parameters (inout):	None		
Parameters (out):	None		
Return value:		E_OK: Conditions have correctly been set E_NOT_OK: Conditions cannot be set E_PENDING: Conditions set is in progress, a further call to this API is needed to end the setting	
Description:	The Dcm_SetProgConditions callout allows the integrator to store relevant information prior to jumping to bootloader. The context parameter are defined in Dcm_ProgConditionsType.		

**J()** 

# 8.5.5 Dcm\_GetProgConditions

# [Dcm544] [

Service name:	Dcm_GetProgConditions		
Syntax:	Dcm_EcuStartModeType Dcm_GetProgConditions(     Dcm_ProgConditionsType * ProgConditions )		
Service ID[hex]:	-		
Sync/Async:	Synchronous		
Reentrancy:	Non Reentrant		
Parameters (in):	None		
Parameters (inout):	None		
Parameters (out):	ProgConditions Conditions on which the jump from the bootloader has been requested		
Return value:	Dcm_EcuStartModeType		
	The Dcm_GetProgConditions callout is called upon DCM initialization and allows to determine if a response (\$50 or \$51) has to be sent depending on request within the bootloader. The context parameter are defined in Dcm_ProgConditionsType.		

**」()** 

# 8.5.6 Dcm\_ProcessRequestTransfertExit

#### Dcm755 [

Service name:	Dcm_ProcessRequest	tTransferExit
Syntax:	Std_ReturnType Dcm_ProcessRequestTransferExit(     Dcm_OpStatusType OpStatus,     uint8* ParameterRecord,     uint32 ParameterRecordSize,     Dcm_NegativeResponseCodeType* ErrorCode )	
Service ID[hex]:	0x32	
Sync/Async:	Asynchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	OpStatus  ParameterRecord  ParameterRecordSiz e	DCM_INITIAL: All In-parameters are valid DCM_PENDING: All In-parameters are set to 0x0 DCM_CANCEL: All In-parameters are set to 0x0 DCM_FORCE_RCRRP_OK: All In-parameters are set to 0x0 (Optional) Pointer to vehicle-manufacturer-specific data (Optional) Length of ParameterRecord in bytes
Parameters (inout):	None	
Parameters (out):	ErrorCode	See below
Return value:	Std_ReturnType	E_OK: Transfer was successful E_NOT_OK: Transfer was not successful E_PENDING: Transfer is not yet finished
Description:	Callout function.  DCM shall call this callout function to terminate a download or upload process.  This service is needed for the implementation of UDS service  RequestTransferExit.	

]()

Dcm759 If the operation Dcm ProcessRequestTransferExit returns value E\_NOT\_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.

# 8.5.7 Dcm\_PorcessRequestUpload

#### Dcm756 [

Service name:	Dcm_ProcessRequestUpload
Syntax:	Std_ReturnType Dcm_ProcessRequestUpload(     Dcm_OpStatusType OpStatus,     uint8 DataFormatIdentifier,     uint32 MemoryAddress,     uint32 MemorySize,     Dcm_NegativeResponseCodeType* ErrorCode )
Service ID[hex]:	0x31
Sync/Async:	Asynchronous

Reentrancy:	Non Reentrant	
	•	DCM_INITIAL: All In-parameters are valid DCM_PENDING: All In-parameters are set to 0x0 DCM_CANCEL: All In-parameters are set to 0x0 DCM_FORCE_RCRRP_OK: All In-parameters are set to 0x0
Parameters (in):	DataFormatIdentifie r	Bit 7 - 4: Compression Method - 0x0: not compressed - 0x1F: vehicle-manufacturer-specific Bit 3 - 0: Encrypting method - 0x0: not encrypted - 0x1F: vehicle-manufacturer-specific
	MemoryAddress	Starting address of server memory from which data are to be copied
	MemorySize	Uncompressed memory size in bytes
Parameters (inout):	None	
Parameters (out):	ErrorCode	See below
Return value:	Std_ReturnType	E_OK: Request was successful E_NOT_OK: Request was not successful E_PENDING: Request is not yet finished
Description:	Callout function.  DCM shall call this callout function to start an upload process. This service is needed for the implementation of UDS service RequestUpload.	

]()

**Dcm758** If the operation Dcm ProcessRequestUpload returns value E\_NOT\_OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.

# 8.5.8 Dcm\_ProcessRequestDownload

### Dcm754 [

Service name:	Dcm_ProcessReque	stDownload
Syntax:	Std_ReturnType Dcm_ProcessRequestDownload(	
Service ID[hex]:	0x30	
Sync/Async:	Asynchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	•	DCM_INITIAL: All In-parameters are valid DCM_PENDING: All In-parameters are set to 0x0 DCM_CANCEL: All In-parameters are set to 0x0 DCM_FORCE_RCRRP_OK: All In-parameters are set to 0x0
	r	Bit 7 - 4: Compression Method - 0x0: not compressed - 0x1F: vehicle-manufacturer-specific Bit 3 - 0: Encrypting method

		<ul><li>0x0: not encrypted</li><li>0x1F: vehicle-manufacturer-specific</li></ul>
	•	Starting address of server memory to which data is to be written
	MemorySize	Uncompressed memory size in bytes
Parameters (inout):	None	
Parameters (out):	BlockLength	Max. Number of bytes for one Dcm_WriteMemory
r arameters (out).	ErrorCode	See below
Return value:	Std_ReturnType	
Description:	Callout function.  DCM shall call this callout function to start a download process. This service is needed for the implementation of UDS service RequestDownload.	

]()

Dcm757 If the operation Dcm ProcessRequestDownload returns value E NOT OK, the DCM module shall send a negative response with NRC code equal to the parameter ErrorCode parameter value.

### 8.6 Scheduled Functions

# 8.6.1 Dcm MainFunction

#### [Dcm053] [

Service name:	Dcm_MainFunction
Syntax:	void Dcm_MainFunction( void )
Service ID[hex]:	0x25
Timing:	FIXED_CYCLIC
Description:	This service is used for processing the tasks of the main loop.

(BSW00424, BSW00373, BSW00376)

[Dcm362] [ Dcm MainFunction shall integrate all scheduled functions (e.g. Diagnostic timer handling) ()

Dcm\_MainFunction() must be called periodically.

[Dcm593] [ If the Dcm MainFunction is called and the DCM module has not been initialized (Call to Dcm Init), the function shall return immediately without performing any functionality and without raising any errors (BSW00450)

# 8.7 Expected Interfaces

In this section all interfaces required from other modules are listed.

# 8.7.1 Mandatory Interfaces

This section defines all interfaces which are required to fulfill the core functionality of the module.

API function	Description
ComM_DCM_ActiveDiagnostic	Indication of active diagnostic by the DCM.
ComM_DCM_InactiveDiagnosti	Indication of inactive diagnostic by the DCM.
С	
PduR_DcmTransmit	Requests transmission of an I-PDU.

# 8.7.2 Optional Interfaces

This section defines all interfaces which are required to fulfill an optional functionality of the module.

API function	Description
BswM_Dcm_CommunicationMode_CurrentStat	Function called by DCM to inform the BswM about the
e	current state of the communication mode.
Dem_DcmCancelOperation	Cancel pending operation started from Dcm.
Dem_DisableDTCRecordUpdate	Disables the event memory update of a specific DTC
	(only one at one time).
Dem_DisableDTCSetting	Disables the DTC setting for a DTC group.
Dem_EnableDTCRecordUpdate	Enables the event memory update of the DTC
	disabled by Dem_DisableDTCRecordUpdate() before.
Dem_EnableDTCSetting	Enables the DTC setting for a DTC group.
Dem_GetDTCByOccurrenceTime	Gets the DTC by occurrence time. There is no explicit
	parameter for the DTC-origin as the origin always is
	DEM_DTC_ORIGIN_PRIMARY_MEMORY.
Dem_GetDTCOfOBDFreezeFrame	Gets DTC by freeze frame record number.
Dem_GetDTCStatusAvailabilityMask	Gets the DTC Status availability mask.
Dem_GetExtendedDataRecordByDTC	Gets extended data by DTC. The function stores the
	data in the provided DestBuffer.
Dem_GetFreezeFrameDataByDTC	Gets freeze frame data by DTC. The function stores
	the data in the provided DestBuffer.
Dem_GetFreezeFrameDataByRecord	Gets DTC and its associated freeze frame record by
	absolute record number. The function stores the data
0.45	in the provided DestBuffer.
Dem_GetFunctionalUnitOfDTC	Gets the functional unit of the requested DTC.
Dem_GetNextFilteredDTC	Gets the next filtered DTC.
Dem_GetNextFilteredDTCAndFDC	Gets the current DTC and its associated Fault
	Detection Counter (FDC) from the Dem. The interface
	has an asynchronous behavior, because the FDC
	might be received asynchronously from a SW-C, too.
Dem_GetNextFilteredDTCAndSeverity	Gets the current DTC and its Severity from the Dem.
Dem_GetNextFilteredRecord	Gets the next freeze frame record number and its

	associated DTC stored in the event memory. The interface has an asynchronous behavior, because NvRAM access might be required.
Dem GetNumberOfFilteredDTC	Gets the number of a filtered DTC.
Dem_GetSeverityOfDTC	Gets the severity of the requested DTC. For large configurations and DTC-calibration, the interface behavior can be asynchronous (splitting the DTC-search into segments).
Dem_GetSizeOfExtendedDataRecordByDTC	Gets the size of extended data by DTC.
Dem_GetSizeOfFreezeFrameByDTC	Gets the size of freeze frame data by DTC.
Dem_GetStatusOfDTC	Gets the status of a DTC. For large configurations and DTC-calibration, the interface behavior can be asynchronous (splitting the DTC-search into segments).
Dem_GetTranslationType	Gets the supported DTC formats of the ECU. The supported formats are configured via DemTypeOfDTCSupported.
Dem_ReadDataOfOBDFreezeFrame	Gets data element per PID and index of the most important freeze frame being selected for the output of service \$02. The function stores the data in the provided DestBuffer.
Dem_SetDTCFilter	The server shall perform a bit-wise logical AND-ing operation between the mask specified in the client's request and the actual status associated with each DTC supported by the server. In addition to the DTCStatusAvailabilityMask, the server shall return all DTCs for which the result of the AND-ing operation is non-zero [i.e. (statusOfDTC & DTCStatusMask) != 0]. If the client specifies a status mask that contains bits that the server does not support, then the server shall process the DTC information using only the bits that it does support. If no DTCs within the server match the masking criteria specified in the client's request, no DTC or status information shall be provided following the DTCStatusAvailabilityMask byte in the positive response message (statusOfDTC & DTCStatusMask) & (severity & DTCSeverityMask) != 0
Dem SetFreezeFrameRecordFilter	Sets a freeze frame record filter.
Det_ReportError	Service to report development errors.
Dlt_ActivateEvent	This function is called by the Dcm if a specific ResponseOnEvent is enabled by a user. The RoeEventID shall be used by the Dlt to notify the Dcm about some actions to do for the ROE service. Normally for the Dlt module, only the ReadDataByldendifer (0x22) should be used for ROE. In addition, when a specific ROE for the Dlt module is disabled/turned off by a user, the Dlt module is notified with this function.
Dlt_ConditionCheckRead	Is called from Dcm when UDS service ReadDataByIdendifer for Dlt DID is called to see if Dlt_ReadData can be called.
Dlt_ReadData	Is called from Dcm when UDS service ReadDataByIdendifer for Dlt DID is called.

Dlt_ReadDataLength	Is called from Dcm when UDS service
	ReadDataByldendifer for Dlt DlD is called.
Dlt_WriteData	Is called from Dcm when UDS service
	WriteDataByldendifer for Dlt DID is called.
IoHwAb_Dcm_ <ecusignalname></ecusignalname>	This function provides control access to a certain ECU Signal to the DCM module ( <ecusignalname> is the symbolic name of an ECU Signal). The ECU signal can be locked and unlocked by this function. Locking 'freezes' the ECU signal to the current value, the configured default value or a value given by the parameter 'signal'.</ecusignalname>
loHwAb_Dcm_Read <ecusignalname></ecusignalname>	This function provides read access to a certain ECU Signal to the DCM module ( <ecusignalname> is the symbolic name of an ECU Signal).</ecusignalname>
NvM_ReadBlock	Service to copy the data of the NV block to its corresponding RAM block.
NvM_SetBlockLockStatus	Service for setting the lock status of a permanent RAM block of an NVRAM block.
NvM_WriteBlock	Service to copy the data of the RAM block to its corresponding NV block.
PduR_DcmCancelReceive	Requests for cancellation of an ongoing reception of an I-Pdu in transport protocol.
PduR_DcmCancelTransmit	Request for cancellation of an ongoing transmission of an I-Pdu in transport protocol or communication interface.
PduR_DcmChangeParameter	Request to change a specific transport protocol parameter (e.g. block-size). The affected transport protocol module is selected using the I-PDU ID.
SchM_ActMainFunction_Dcm	Invokes the SchM_ActMainFunction function to trigger the activation of a corresponding main processing function.

Dem ReadDataOfOBDFreezeFrame is only required when OBD Service \$02 is configured (see configuration parameter DcmDsdSidTabServiceId).

# 8.7.3 Configurable Interfaces

This section defines the interfaces where the DCM configuration defines the actual functions that the DCM will use. Depending on the configuration, an implementation of these functions could be provided by other BSW-modules (typically the DEM) or by software-components (through the RTE).

#### 8.7.3.1 SecurityAccess\_<LEVEL>

Provides functions required for the UDS Service SecurityAccess (see Dcm323, Dcm324).

```
[Dcm685] ClientServerInterface SecurityAccess <LEVEL>
PossibleErrors {
  E NOT OK = 1,
  E PENDING = 10, // application process not yet completed
188 of 339
                                         Document ID 018: AUTOSAR_SWS_DiagnosticCommunicationManager
                               - AUTOSAR confidential -
```

```
E COMPARE KEY FAILED = 11 // compare failed
};
//Request to application for provision of seed value
//SecurityAccessDataRecord: This data record contains additional
//data to calculate the seed value; if size is 0 the parameter is
//still present but a "NULL"-pointer is passed
//Seed: Pointer for provided seed
//If the parameter DcmDspSecurityADRSize is present, the following
interface is used:
GetSeed(IN uint8 SecurityAccessDataRecord[<DcmDspSecurityADRSize>],
        IN Dcm OpStatusType OpStatus,
        OUT uint8 Seed[<DcmDspSecuritySeedSize>],
        OUT NegativeResponseCodeType ErrorCode,
        ERR{E NOT OK, E PENDING});
//If the parameter DcmDspSecurityADRSize is not present, the
following interface is used:
GetSeed(IN Dcm OpStatusType OpStatus,
        OUt uint8 Seed[<DcmDspSecuritySeedSize>],
        OUT NegativeResponseCodeType ErrorCode,
        ERR{E NOT OK, E PENDING});
//Request to application for comparing key
//Key: Key, which needs to be compared
CompareKey(IN uint8 Key[<DcmDspSecurityKeySize>],
                IN Dcm OpStatusType OpStatus,
           ERR{E NOT OK, E PENDING, E COMPARE KEY FAILED});
1()
```

[Dcm659] [ If the operation GetSeed() return value E NOT OK, the DCM module shall send a negative response with NRC code equal to ErrorCode parameter value. ()

[Dcm660] If the operation CompareKey() return value E COMPARE KEY FAILED or E NOT OK, the DCM module shall send a negative response with NRC 0x35 (InvalidKey) and shall not change the DCM internal security level. (()

From the point of view of the DCM, the operation has the following signature (when DcmDspSecurityADRSize is present):

```
Std ReturnType Xxx GetSeed(uint8* SecurityAccessDataRecord,
                           Dcm OpStatusType* OpStatus,
                           uint8* Seed,
                           Dcm NegativeResponseCodeType* ErrorCode)
Std ReturnType Xxx CompareKey(uint8* Key)
```

From the point of view of the DCM, the operation has the following signature (when DcmDspSecurityADRSize is not present):

```
Std ReturnType Xxx GetSeed(Dcm_OpStatusType* OpStatus,
189 of 339
                                              Document ID 018: AUTOSAR_SWS_DiagnosticCommunicationManager
                                  - AUTOSAR confidential -
```

R4.0 Rev 3

#### 8.7.3.2 DataServices <Data>

One DataServices interface will be generated for each Data of each DID/PID, with following possible operations:

#### 8.7.3.2.1 ReadData

ReadData allows requesting to the application a data value of a DID/PID. A ReadData interface is defined for every data of each DID/PID with read access. The Data specific type is an array of uint8 which represents either the fix length of this Data or the maximum possible length of this Data. If the length is variable, the operation ReadDataLength has to provide the current valid data length of this Data. This interface is used for UDS Service ReadDataByldentifier and for UDS Service ReadDataByPeriodicIdentifier (0x2A) and for UDS Service InputOutputControlByldentifier (0x2F).

The ReadData interface can be defined as synchronous or asynchronous according to configuration parameter DcmDspDataUsePort.

The synchronous mechanism of the ReadData interface is compatible to the related DEM interface to allow the provider to use the same interface for both DCM and DEM.

#### 8.7.3.2.2 WriteData

WriteData requests the application to write a data value of a DID. The Data specific type is an array of uint8 which represent either the fix length of this Data or the maximum possible length of this Data. A WriteData interface is defined for every data of each DID with write access

This interface is used for the UDS Service WriteDataByldentifier (0x2E).

#### 8.7.3.2.3 ReadDataLength

ReadDataLength requests the application to return the data length of a Data. A ReadDataLength interface is defined for every data of each DID with variable data length.

This interface is used for UDS Service ReadDataByldentifier and for UDS Service ReadDataByPeriodicIdentifier (0x2A)

#### 8.7.3.2.4 ConditionCheckRead

ConditionCheckRead requests to the application if the conditions (System state,...) to read the Data are correct. This operation is called for all requested DIDs before requesting the data of each DID.

A ConditionCheckRead interface is defined for every data of each DID with read access

#### 8.7.3.2.5 **GetScalingInformation**

Request to the application for the scaling information of a Data (see Dcm394)

#### 8.7.3.2.6 ReturnControlToEcu

Request to the application to return control to ECU of an IOControl (see Dcm396)

#### 8.7.3.2.7 ResetToDefault

Request to the application to reset an IOControl to default value (see Dcm397)

#### 8.7.3.2.8 FreezeCurrentState

Request to the application to freeze the current state of an IOControl (see <a href="Dcm398">Dcm398</a>)

### 8.7.3.2.9 **ShortTermAdjustment**

Request to the application to adjust the IO signal (see <u>Dcm399</u>).

#### 8.7.3.2.10 Client Server interface

Using the concepts of the SW-C template, the interface is defined as follows if ClientServer interface used(DcmDspDataUsePort is set to USE DATA SYNCH CLIENT SERVER or USE DATA ASYNCH CLIENT SERVER):

```
[Dcm686] [ ClientServerInterface DataServices < Data>
PossibleErrors {
 E NOT OK = 1,
  E PENDING = 10,
//the next operation is provided if the Data can be read and is
//used
// to get the data value of a DID or PID from a SW-C
// the server is not allowed to return E NOT OK, but shall always
// provide a valid data value (e.g. a default/replacement value
// in an error-case) to Dcm/Dem
// nevertheless the signature of the operation includes E NOT OK to
// ensure compatibility between server runnable and RTE Call API,
// since the RTE may return negative Std Return values in certain
// cases (e.g. partition of server stopped)
//if DcmDspDataUsePort is set to USE DATA SYNCH CLIENT SERVER, the
//following definition is used
ReadData(OUT uint8 Data[(<DcmDspDataSize>+7)/8],
         ERR(E NOT OK)
```

```
//if DcmDspDataUsePort is set to USE DATA ASYNCH CLIENT SERVER, the
//following definition is used
ReadData(IN Dcm OpStatusType OpStatus,
         OUT uint8 Data[(<DcmDspDataSize>+7)/8],
         ERR{E NOT OK, E PENDING)
//the next operation is provided if the Data can be written
//data : Data value
//dataLength: optional. Available, if the data length of
//the Data is variable. It defines the size of valid data in
//the parameter data
//if DcmDspDataFixedLength is set to FALSE, the following definition
is used
WriteData(IN uint8 Data[(<DcmDspDataSize>+7)/8],
          IN uint16 DataLength,
          IN Dcm OpStatusType OpStatus,
          OUT NegativeResponseCodeType ErrorCode,
          ERR{E NOT OK, E PENDING})
//if DcmDspDataFixedLength is set to TRUE, the following definition
is used
WriteData(IN uint8 Data[(<DcmDspDataSize>+7)/8],
          IN Dcm OpStatusType OpStatus,
          OUT NegativeResponseCodeType ErrorCode,
          ERR{E NOT OK, E PENDING})
//the next operation is provided optionally if the Data's length is
variable
//DataLength: Data length of the Data
//The module providing this operation shall ensure that the
//datalength provided within this operation is consistent with the
//data length in the associated ReadData operation
// the server is not allowed to return E NOT OK, but shall always
// provide a valid data value (e.g. a default/replacement value
// in an error-case) to Dcm/Dem
// nevertheless the signature of the operation includes E NOT OK to
// ensure compatibility between server runnable and RTE Call API,
// since the RTE may return negative Std Return values in certain
// cases (e.g. partition of server stopped)
ReadDataLength (OUT uint16 DataLength,
               ERR{E NOT OK })
//the next operation is always provided
ConditionCheckRead(IN Dcm OpStatusType OpStatus,
                   OUT NegativeResponseCodeType ErrorCode,
                   ERR{E NOT OK, E PENDING})
//the next operation is provided optionally
GetScalingInformation(IN Dcm OpStatusType OpStatus,
  OUT uint8 ScalingInfo[<DcmDspDataScalingInfoSize>],
  OUT NegativeResponseCodeType ErrorCode,
  ERR{E NOT OK, E PENDING} )
```

```
//the next operation is provided optionally
ReturnControlToECU(IN Dcm OpStatusType OpStatus,
                   OUT NegativeResponseCodeType ErrorCode,
                   ERR{E NOT OK, E PENDING})
//the next operation is provided optionally

//the next operation is provided optionally
ShortTermAdjustment(IN uint8
ControlOptionRecord[(<DcmDspDataSize>+7)/8],
                     IN Dcm OpStatusType OpStatus,
                     OUT NegativeResponseCodeType ErrorCode,
                     ERR{E NOT OK, E PENDING})
```

#### 8.7.3.2.11 Sender Receiver interface

Using the concepts of the SW-C template, the interface is defined as follows if SenderReceiver interface used (DcmDspDataUsePort is USE DATA SENDER RECEIVER):

```
[Dcm687] [ SenderReceiver DataServices < Data>
  <datatype> Data
} ()
```

#### 8.7.3.2.12 DataServices callout

From the point of view of the DCM, the operations have the following signatures:

Note: The OpStatus parameter should only be used for asynchronous operations (if DcmDspDataUsePort is set to USE DATA ASYNCH CLIENT SERVER USE DATA ASYNCH FNC). In case of synchronous operations (DcmDspDataUsePort is set to USE DATA SYNCH CLIENT SERVER USE DATA SYNCH FNC), the OpStauts parameter should not be used.

#### 8.7.3.2.12.1 ReadData

if DcmDspDataUsePort is set to USE DATA SYNCH CLIENT SERVER, the following definition is used:

#### Dcm793F

Service name:	Xxx_ReadData	
Syntax:	Std_ReturnType Xxx_ReadDat uint8* Data )	a(
Service ID[hex]:	0x34	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	None	
Parameters (inout):	None	
Parameters (out):	Data Buffer where the requested data shall be copied to	
Return value:	Std_ReturnType E_OK: this value is always returned.	
Description:	This function requests to the application a data value of a DID/PID if DcmDspDataUsePort is set to USE_DATA_SYNCH_CLIENT_SERVER.	

if DcmDspDataUsePort is set to USE\_DATA\_ASYNCH\_CLIENT\_SERVER, the following definition is used:

Service name:	Xxx_ReadData		
Syntax:	Std_ReturnType Xxx_ReadData(     Dcm_OpStatusType OpStatus,     uint8* Data )		
Service ID[hex]:	0x3b		
Sync/Async:	Asynchronous		
Reentrancy:	Non Reentrant	Non Reentrant	
Parameters (in):	OpStatus	Status of the current operation	
Parameters (inout):	None		
Parameters (out):	Data	Buffer where the requested data shall be copied to	
Return value:	Std_ReturnType	E_OK: Request was successful. E_PENDING: Request is not yet finished. Further call(s) required to finish.	
Description:	This function requests to the application a data value of a DID/PID if DcmDspDataUsePort is set to USE_DATA_ASYNCH_CLIENT_SERVER.		

]()

#### 8.7.3.2.12.2 WriteData

if DcmDspDataFixedLength is set to TRUE, the following definition is used:

Service name:	Xxx_WriteData
Syntax:	Std_ReturnType Xxx_WriteData( uint8* Data,

	Dcm_OpStatusType OpStatus, Dcm_NegativeResponseCodeType* ErrorCode	
	)	
Service ID[hex]:	0x35	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	Data	Buffer containing the data to be written
raiaineteis (iii).	OpStatus	Status of the current operation
Parameters (inout):	None	
Parameters (out):		NRC to be sent in the negative response in case of failure (E_NOT_OK)
Return value:	e	E_OK: Request was successful. E_NOT_OK: Request was not successful. E_PENDING: Request is not yet finished. Further call(s) required to finish.
Description:	This function requests the application to write a data value of a DID.	

if DcmDspDataFixedLength is set to FALSE, the following definition is used:

Service name:	Xxx_WriteData	
Syntax:	Std_ReturnType Xxx_WriteData(     uint8* Data,     uint16 DataLength,     Dcm_OpStatusType OpStatus,     Dcm_NegativeResponseCodeType* ErrorCode )	
Service ID[hex]:	0x3e	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
	Data	Buffer containing the data to be written
Parameters (in):	DataLength	Length of the data to be writen/read
	OpStatus	Status of the current operation
Parameters (inout):	None	
Parameters (out):	ErrorCode	NRC to be sent in the negative response in case of failure (E_NOT_OK)
Return value:	e	E_OK: Request was successful. E_NOT_OK: Request was not successful. E_PENDING: Request is not yet finished. Further call(s) required to finish.
Description:	This function rec	uests the application to write a data value of a DID.

**J()** 

#### ReadDataLength 8.7.3.2.12.3

Service name:	Xxx_ReadDataLength

Syntax:	Std_ReturnType Xxx_Readl uint16* DataLength )	DataLength(
Service ID[hex]:	0x36	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	None	
Parameters (inout):	None	
Parameters (out):	DataLength Length of the data to be writen/read	
Return value:	Std_ReturnType	E_OK: this value is always returned.
Description:	This function requests the	application to return the data length of a Data.

**J()** 

#### ConditionCheckRead 8.7.3.2.12.4

#### Dcm797

Service name:	Xxx_ConditionCheckRead	
Syntax:	Std_ReturnType Xxx_ConditionCheckRead(	
Service ID[hex]:	0x37	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	OpStatus	Status of the current operation
Parameters (inout):	None	
Parameters (out):		NRC to be sent in the negative response in case of failure (E_NOT_OK)
Return value:	e	E_OK: Request was successful. E_NOT_OK: Request was not successful. E_PENDING: Request is not yet finished. Further call(s) required to finish.
Description:	This function requests to the application if the conditions to read the Data are correct.	

**J()** 

#### GetScalingInformation 8.7.3.2.12.5

Service name:	Xxx_GetScalingInformation
Syntax:	Std_ReturnType Xxx_GetScalingInformation(

	)	
Service ID[hex]:	0x38	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	OpStatus Status of the current operation	
Parameters (inout):	None	
	ScalingInfo	Scaling information
Parameters (out):		NRC to be sent in the negative response in case of failure (E_NOT_OK)
Return value:	e	E_OK: Request was successful. E_NOT_OK: Request was not successful. E_PENDING: Request is not yet finished. Further call(s) required to finish.
Description:	This function requests to the application for the scaling information of a Data.	

**J()** 

#### ReturnControlToECU 8.7.3.2.12.6

### Dcm799

Γ

Service name:	Xxx_ReturnCont	rolToECU
Syntax:	Std_ReturnType Xxx_ReturnControlToECU(     Dcm_OpStatusType OpStatus,     Dcm_NegativeResponseCodeType* ErrorCode )	
Service ID[hex]:	0x39	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	OpStatus	Status of the current operation
Parameters (inout):	None	
Parameters (out):		NRC to be sent in the negative response in case of failure (E_NOT_OK)
Return value:	e	E_OK: Request was successful. E_NOT_OK: Request was not successful. E_PENDING: Request is not yet finished. Further call(s) required to finish.
Description:	This function requests to the application to return control to ECU of an IOControl.	

**J()** 

#### ResetToDefault 8.7.3.2.12.7

Service name:	Xxx_ResetToDefault
Syntax:	Std_ReturnType Xxx_ResetToDefault(

	Dcm_NegativeResponseCodeType* ErrorCode )		
Service ID[hex]:	0x3c		
Sync/Async:	Synchronous		
Reentrancy:	Non Reentrant		
Parameters (in):	OpStatus Status of the current operation		
Parameters (inout):	None		
Parameters (out):		NRC to be sent in the negative response in case of failure (E_NOT_OK)	
Return value:	e	E_OK: Request was successful. E_NOT_OK: Request was not successful. E_PENDING: Request is not yet finished. Further call(s) required to finish.	
Description:	This function req	uests to the application to reset an IOControl to default value.	

**J()** 

#### **FreezeCurrentState** 8.7.3.2.12.8

### Dcm801

Γ

Service name:	Xxx_FreezeCurr	Xxx_FreezeCurrentState		
Syntax:	Std_ReturnType Xxx_FreezeCurrentState(			
Service ID[hex]:	0x3a			
Sync/Async:	Synchronous			
Reentrancy:	Non Reentrant			
Parameters (in):	OpStatus	Status of the current operation		
Parameters (inout):	None			
Parameters (out):		NRC to be sent in the negative response in case of failure (E_NOT_OK)		
Return value:	Std_ReturnTyp			
Description:	This function requests to the application to freeze the current state of an IOControl.			

() ا

#### 8.7.3.2.12.9 **ShortTermAdjustment**

#### Dcm802

Service name:	Xxx_ShortTermAdjus	stment	
Syntax:	Std_ReturnType Xxx_ShortTermAdjustment(     uint8* ControlOptionRecord,     Dcm_OpStatusType OpStatus,     Dcm_NegativeResponseCodeType* ErrorCode )		
Service ID[hex]:	0x3d		
Sync/Async:	Synchronous		
Reentrancy:	Non Reentrant		
Parameters (in):	ControlOptionRecor d	Control option parameter for the adjustment request	
	OpStatus	Status of the current operation	
Parameters (inout):	None		
Parameters (out):	ErrorCode	NRC to be sent in the negative response in case of failure (E_NOT_OK)	
Return value:	Std_ReturnType	E_OK: Request was successful. E_NOT_OK: Request was not successful. E_PENDING: Request is not yet finished. Further call(s) required to finish.	
Description:	This function request	s to the application to adjust the IO signal.	

]()

### 8.7.3.3 DataServices\_DIDRange\_<Range>

#### 8.7.3.3.1 Client Server interface

The following interface defines an operation needed to get the DID range

```
[Dcm769] [ClientServerInterface DataServices DIDRange <Range>
PossibleErrors {
  E_NOT_OK = 1,
  E^{-}PENDING = 10
```

```
};
//the next operation is provided optionally if there are no gaps in
the DID-ranges
//this operation shall return if a specific DID is available within
the range or not.
IsDidAvailable (IN uint16 DID,
               OUT uint8 supported,
               ERR\{E\ NOT\ OK\}) // in case there are no gaps in the
range this operation shall be optional
ReadDidData(IN uint16 DID,
         OUT uint8 Data[<DcmDspDidRangeMaxLength>],
         IN Dcm OpStatusType OpStatus,
         OUT uint16 DataLength,
         OUT NegativeResponseCodeType ErrorCode,
         ERR{E NOT OK, E PENDING})
WriteDidData(IN uint16 DID,
          IN uint8 Data[<DcmDspDidRangeMaxLength>],
          IN Dcm OpStatusType OpStatus,
          IN uint16 DataLength,
          OUT NegativeResponseCodeType ErrorCode,
          ERR{E NOT OK, E PENDING})
}
1()
```

#### 8.7.3.3.2 DataServices callout

From the point of view of the DCM, the operations have the following signatures:

Note: The OpStatus parameter should only be used for asynchronous operations (if DcmDspDataUsePort is set to USE DATA ASYNCH CLIENT SERVER USE DATA ASYNCH FNC). In case of synchronous operations USE DATA SYNCH CLIENT SERVER (DcmDspDataUsePort is set to USE DATA SYNCH FNC), the OpStauts parameter should not be used.

#### 8.7.3.3.2.1 IsDidAvailable

#### Dcm803

Γ

Service name:	Xxx_IsDidAvailable
Syntax:	Std_ReturnType Xxx_IsDidAvailable(     uint16 DID,     uint8* supported )
Service ID[hex]:	0x3F
Sync/Async:	Synchronous
Reentrancy:	Non Reentrant
Parameters (in):	DID DID value
Parameters (inout):	None

# ▲ Specification of Diagnostic Communication Manager

V4.2.0

R4.0 Rev 3

Parameters (out):	supported	Indicate if the DID is available within the range or not
Return value:	Std_ReturnType	E_OK: this value is always returned.
Description:	This function reque	sts if a specific DID is available within the range or not.

ر)(

### 8.7.3.3.2.2ReadDidData

#### Dcm804

Service name:	Xxx_ReadDid	Data		
Syntax:	Std_ReturnType Xxx_ReadDidData(     uint16 DID,     uint8* Data,     Dcm_OpStatusType OpStatus,     uint16 DataLength,     Dcm_NegativeResponseCodeType ErrorCode )			
Service ID[hex]:	0x40			
Sync/Async:	Synchronous	Synchronous		
Reentrancy:	Non Reentrant			
Parameters (in):	DID	Data ID value		
r arameters (iii).	OpStatus	Status of the current operation		
Parameters (inout):	None			
	Data	Buffer where the requested data shall be copied to		
Parameters (out):	DataLength	Length of the data to be read		
i didifficiers (odi).	ErrorCode	NRC to be sent in the negative response in case of failure (E_NOT_OK)		
Return value:	e	E_OK: Request was successful. E_NOT_OK: Request was not successful. E_PENDING: Request is not yet finished. Further call(s) required to finish.		
Description:	This function red	uests to the application a data value of a DID		

]()

### 8.7.3.3.2.3 Write Did Data

Service name:	Xxx_WriteDidData	
Syntax:	Std_ReturnType Xxx_WriteDidData(     uint16 DID,     uint8* Data,     Dcm_OpStatusType OpStatus,     uint16 DataLength,     Dcm_NegativeResponseCodeType ErrorCode )	
Service ID[hex]:	0x41	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
	DID	Data ID value
Parameters (in):	Data	Buffer containing the data to be written
	OpStatus	Status of the current operation
	DataLength	Length of the data to be written

Parameters (inout):	None	
Parameters (out):		NRC to be sent in the negative response in case of failure (E_NOT_OK)
	e	E_OK: Request was successful. E_NOT_OK: Request was not successful. E_PENDING: Request is not yet finished. Further call(s) required to finish.
•	This function req DID.	uests the application to write a data value of a

]()

#### 8.7.3.4 InfotypeServices <VEHINFODATA>

The following interface defines an operation needed to get data from one or several SW-C in order to supply OBD Service \$09 (see Dcm423).

Using the concepts of the SW-C template, the interface is defined as follows:

```
[Dcm688] ClientServerInterface InfotypeServices <VEHINFODATA>
PossibleErrors {
 E NOT OK = 1,
 E PENDING = 10
};
// used to get Infotype data from SW-C
// the return value E PENDING is not allowed for data of InfoType
// 0x04, 0x08, 0x0A and 0x0B
//return value E NOT OK is not allowed as a data value has always
// to be provided to DCM
GetInfotypeValueData(IN Dcm OpStatusType OpStatus,
  OUT uint8 DataValueBuffer[<DcmDspVehInfoDataSize>],
  ERR{E NOT OK, E PENDING})
```

From the point of view of the DCM, the operation has the following signature:

```
Std ReturnType Xxx GetInfotypeValueData(Dcm OpStatusType OpStatus,
       uint8* DataValueBuffer) ()
```

#### 8.7.3.5 DTRServices

The following interface defines an operation needed to supply OBD Service \$06 (see Dcm416).

```
[Dcm689] [ClientServerInterface DTRServices
PossibleErrors {
  E NOT OK = 1,
};
// used to get DTR data from SW-C for service 6
//return value E NOT OK is not allowed as a data value has always
                                        Document ID 018: AUTOSAR_SWS_DiagnosticCommunicationManager
203 of 339
                              - AUTOSAR confidential -
```

R4.0 Rev 3

```
// to be provided to DCM
GetDTRValue(IN Dcm OpStatusType OpStatus,
 OUT uint16 Testval,
 OUT uint16 Minlimit,
 OUT uint16 Maxlimit,
 OUT DTRStatusType Status,
 ERR{E NOT OK });
ImplementationDataType DTRStatusType {
     LOWER-LIMIT = 0
     UPPER-LIMIT = 255
 0x00 -> DCM DTRSTATUS VISIBLE
```

From the point of view of the DCM, the operation has the following signature:

```
Std ReturnType Xxx GetDTRValue(Dcm OpStatusType OpStatus,
                                uint16* Testval,
                                uint16* Minlimit,
                                uint16* Maxlimit,
                                uint8* Status) ()
```

#### 8.7.3.6 RoutineServices < ROUTINENAME>

0x01 -> DCM DTRSTATUS INVISIBLE

The following interface defines operations needed for the UDS Service RoutineControl (0x31) (see Dcm400, Dcm401, Dcm402, Dcm403, Dcm404, Dcm405).

```
[Dcm690] [ClientServerInterface RoutineServices <RoutineName>
PossibleErrors {
      E NOT OK = 1,
      E \overline{PENDING} = 10,
      E FORCE RCRRP = 12,//application request the transmission of
                          //a response Response Pending (NRC 0x78)
      };
//the next operation is always present
//If DcmDspRoutineFixedLength is set to FALSE, the following
definition is used
Start(IN <datatype> dataIn1,..., IN uint8
dataInN[(<DcmDspRoutineSignalLength of
DcmDspStartRoutineInSignal> +7)/8],
      IN Dcm OpStatusType OpStatus,
      OUT <datatype> dataOut1,..., OUT uint8
dataOutN[(<DcmDspRoutineSignalLength of</pre>
DcmDspStartRoutineOutSignal> +7)/8],
      INOUT uint16 currentDataLength,
      OUT NegativeResponseCodeType ErrorCode,
      ERR{E NOT OK, E PENDING, E FORCE RCRRP })
```

```
//If DcmDspRoutineFixedLength is set to TRUE, the following
definition is used
Start(IN <datatype> dataIn1,..., IN <datatype> dataInN,
      IN Dcm OpStatusType OpStatus,
      OUT <datatype> dataOut1,..., OUT <datatype> dataOutN,
      OUT NegativeResponseCodeType ErrorCode,
      ERR{E NOT OK, E PENDING, E FORCE RCRRP })
//the next operation is present if the routine can be stopped
//If DcmDspRoutineFixedLength is set to FALSE, the following
definition is used
Stop(IN <datatype> dataIn1,..., IN uint8
dataInN[(<DcmDspRoutineSignalLength of
DcmDspRoutineStopInSignal> +7)/8],
     IN Dcm OpStatusType OpStatus,
     OUT <datatype> dataOut1,..., OUT uint8
dataOut[(<DcmDspRoutineSignalLength of
DcmDspRoutineStopOutSignal> +7) /8],
     INOUT uint16 currentDataLength,
     OUT NegativeResponseCodeType ErrorCode,
     ERR{ E NOT OK, E PENDING, E FORCE RCRRP })
//If DcmDspRoutineFixedLength is set to TRUE, the following
definition is used
Stop(IN <datatype> dataIn1,..., IN <datatype> dataInN,
     IN Dcm OpStatusType OpStatus,
     OUT <datatype> dataOut1,..., OUT <datatype> dataOutN,
     OUT NegativeResponseCodeType ErrorCode,
     ERR{ E NOT OK, E PENDING, E FORCE RCRRP })
//the next operation is present if the status of
//the routine can be requested
//If DcmDspRoutineFixedLength is set to FALSE, the following
definition is used
RequestResults (IN Dcm OpStatusType OpStatus,
               OUT <datatype> dataOut1,..., OUT uint8
dataOutN[(<DcmDspRoutineSignalLength of
DcmDspRoutineRequestResOutSignal> +7) /8],
               OUT uint16 currentDataLength,
               OUT NegativeResponseCodeType ErrorCode,
               ERR{ E NOT OK, E PENDING, E FORCE RCRRP })
//If DcmDspRoutineFixedLength is set to TRUE, the following
definition is used
RequestResults (IN Dcm OpStatusType OpStatus,
               OUT <datatype> dataOut1,..., OUT <datatype> dataOutN,
               OUT NegativeResponseCodeType ErrorCode,
               ERR{ E NOT OK, E PENDING, E FORCE RCRRP })
} ()
```

[Dcm668] [ If the operation Start() returns value E NOT OK, the DCM module shall send a negative response with NRC code equal to ErrorCode parameter value. ()

[Dcm669] [ If the operation Start() returns value E FORCE RCRRP, the DCM module shall start the transmission of NRC 0x78. ()

**[Dcm670]** [ If the operation Stop() returns value E NOT OK, the DCM module shall send a negative response with NRC code equal to ErrorCode parameter value. ()

[Dcm671] [ If the operation Stop() returns value E FORCE RCRRP, the DCM module shall start the transmission of NRC 0x78. ()

[Dcm672] [ If the operation RequestResults() returns value E NOT OK, the DCM module shall send a negative response with NRC code equal to ErrorCode parameter value. ()

[Dcm673] [ If the operation RequestResults () returns value E FORCE RCRRP, the DCM module shall start the transmission of NRC 0x78. ()

#### From the point of view of the DCM, the operations have the following signatures: //If DcmDspRoutineFixedLength is set to FALSE, the following

```
definition is used
Std ReturnType Xxx Start(<datatype> dataIn1,...,uint8* dataInN,
                          Dcm OpStatusType OpStatus,
                          <datatype> dataOut1,...,uint8* dataOutN,
                         uint16* currentDataLength,
                         Dcm NegativeResponseCodeType* ErrorCode)
//If DcmDspRoutineFixedLength is set to TRUE, the following
definition is used
Std ReturnType Xxx Start(<datatype> dataIn1,...,<datatype> dataInN,

                        Dcm NegativeResponseCodeType* ErrorCode)
```

### 8.7.3.7 RequestControlServices <TID>

The interface RequestControlServices <TID> allows the DCM to provide OBD Service \$08 (see Dcm419).

Using the concepts of the SW-C template, the interface is defined as follows:

```
[Dcm691] ClientServerInterface RequestControlServices <TID> {
PossibleErrors {
  E NOT OK = 1,
RequestControl(
  OUT OutBuffer uint8[<DcmDspRequestControlOutBufferSize>],
  IN InBuffer uint8[<DcmDspRequestControlInBufferSize>],
  ERR{E NOT OK })
```

From the point of view of the DCM, the operation has the following signature: Std ReturnType Xxx RequestControl(uint8\* OutBuffer, uint8\* InBuffer)

#### 8.7.3.8 CallbackDCMRequestServices

The interface CallbackDCMRequestServices provides information on the status of the protocol communication and allows the Application to disallow a protocol (see Dcm036, Dcm144, Dcm145, Dcm146, Dcm147, Dcm459).

```
[Dcm692] ClientServerInterface CallbackDCMRequestServices {
PossibleErrors {
  E NOT OK = 1,
207 of 339
```

R4.0 Rev 3

```
E PROTOCOL NOT ALLOWED = 5, //conditions in application allows no
                              // further procession of protocol
};
//Indication of protocol start. Application is able to reject
//further processing of requested protocol due to failed
//conditions.
StartProtocol(IN ProtocolType ProtocolID,
             ERR{E PROTOCOL NOT ALLOWED, E NOT OK });
//Indication of protocol stop. If a running diagnostic
//requested is preempted by a higher prior request (of an
//other protocol, e.g. OBD), application is requested to abort
//further processing of running request
//ProtocolID: Name of the protocol(IDs configured within
//DCM PROTOCOL ID)
StopProtocol(IN ProtocolType ProtocolID,
            ERR{E NOT OK});
```

[Dcm674] [ If the operation StartProtocol() returns value E NOT OK or E PROTOCOL NOT ALLOWED, the DCM module shall send a negative response with NRC 0x22 (Conditions not correct). ()

From the point of view of the DCM, the operations have the following signatures:

Std ReturnType Xxx StartProtocol(Dcm ProtocolType ProtocolID) Std ReturnType Xxx StopProtocol(Dcm ProtocolType ProtocolID)

### 8.7.3.9 ServiceRequestNotification

The interface ServiceRequestNotification indicates to the Application that a service is about to be executed and allows the Application to reject the execution of the service request (see Dcm218, Dcm462, Dcm463).

```
[Dcm694] ClientServerInterface ServiceRequestNotification {
PossibleErrors {
  E NOT OK = 1,
  E = REQUEST NOT ACCEPTED = 8,
};
//Indication of the successful reception of a new request to
// application and it is called right before before the DSD
verification (SID, security access, diagnostic session). Within
// this function application can examine the permission of the
// diagnostic service / environment (e.g. ECU state afterrun).
// Return of application will lead to an acceptance of diagnostic
//request, reject of diagnostic request (E REQUEST NOT ACCEPTED ->
// no response will be send) or to an NRC (E NOT OK) with
// value from ErrorCode parameter
//SID: Value of service identifier
//RequestData: This parameter contains the complete request
//data (diagnostic buffer), except the service ID.
//DataSize: This parameter defines how many bytes in the
//RequestData parameter are valid
//ReqType: Addressing type of the request(0=physical request
//1=functional request)
//SourceAddress: Dcm client description
Indication (IN uint8 SID,
           IN uint8 RequestData[<Data size>],
           IN uint16 DataSize,
           IN uint8 ReqType,
             IN uint16 SourceAddress,
           OUT NegativeResponseCodeType* ErrorCode,
           ERR{E REQUEST NOT ACCEPTED, E NOT OK });
//Confirmation of the successful reception of a new request to
// application
//SID: Value of service identifier
//ReqType: Addressing type of the request(0=physical request
//1=functional request)
//SourceAddress: Dcm client description
//SourceAddress: Dcm client description
//ConfirmationStatus: Confirmation of a successful transmission or a
transmission error of a diagnostic service.
Confirmation (
           IN uint8 SID,
           IN uint8 ReqType,
           IN uint16 SourceAddress,
           IN ConfirmationStatusType ConfirmationStatus,
           ERR{E_NOT_OK});
```

**[Dcm677]** ☐ If the operation Indication() returns value E\_REQUEST\_NOT\_ACCEPTED, the DCM module shall not send any diagnostic response and shall end the current diagnostic request management. ()

[Dcm678] \( \text{ If the operation Indication() or Confirmation() returns value E\_NOT\_OK, the DCM module shall send a negative response with NRC value equal to ErrorCode parameter value.\( )

```
From the point of view of the DCM, the operations has the following signatures:

Std_ReturnType Xxx_Indication(uint8 SID, uint8* RequestData, uint16
DataSize, uint8 ReqType, uint16 SourceAddress,
Dcm_NegativeResponseCodeType* ErrorCode )

Std_ReturnType Xxx_Confirmation(uint8 SID, uint8 ReqType, uint16 SourceAddress, Dcm_ConfirmationStatusType ConfirmationStatus)
```

#### 8.7.3.10 GeneralRequiredROEServices

The following interface defines an operation needed to supply ROE ISO Service.

```
Dcm765   ClientServerInterface GeneralRequiredROEServices
{
   PossibleErrors {
        E_NOT_OK = 1,
        };

   // used to manage an ROE event with EventWindowTime
   ROEInit (IN uint8 EventWindowTime, ERR{E_NOT_OK});

   // used to stop the EventWindowTime when the ROE is stopped by an
   //Diagnostic Request
   ROEStop (void, ERR{E_NOT_OK});
```

#### 8.7.3.11 GeneralProvidedROEServices

The following interface defines an operation needed to supply ROE ISO Service.

Using the concepts of the SW-C template, the interface is defined as follows:

```
Dcm772    ClientServerInterface GeneralRequiredROEServices
{
    PossibleErrors {
        E_NOT_OK = 1,
        };

StopROE (ERR{E_NOT_OK});

RestartROE (ERR{E_NOT_OK});
}    J()
```

From the point of view of the DCM, the operations has the following signatures:

```
Std_ReturnType Xxx_ROEInit (uint8 EventWindowTime)
Std_ReturnType Xxx_ROEStop (void)
```

#### 8.7.3.12 ROEServices

The following interface defines an operation needed to supply ROE ISO Service. Using the concepts of the SW-C template, the interface is defined as follows:

```
[Dcm695] 「ClientServerInterface ROEServices
{
   PossibleErrors {
        E_NOT_OK = 1,
      };

// used to activate an ROE event
ActivateEvent(IN uint8 RoeEventId,
      IN Dcm_RoeStateType RoeState,
      ERR{E_NOT_OK});

} ]()
```

[Dcm679] [ If the operation ActivateEvent() returns value E NOT OK, the DCM module shall send a negative response with NRC 0x31 (Request out of range) ()

From the point of view of the DCM, the operations has the following signatures:

```
Std ReturnType Xxx ActivateEvent (uint8 RoeEvenId,
                                Dcm RoeStateType RoeState)
```

# 8.8 DCM as Service-Component

This section formally specifies the corresponding AUTOSAR Service using the concepts of the Software-Component-Template.

The following definition can be generated completely out of the configuration of the DCM, which defines the exact ports that are present and their names.

**Naming of the port:** The prefix of the port name is fixed and defined herafter (e.g. DataServices ). The name behind the prefix corresponds to the name of the associated container in the ECU configuration and can be freely defined during the configuration step.

e.g.: for a DcmDspData container called Speed the port name would be DataServices\_Speed

```
ServiceSwComponentType Dcm {
  //the presence and name of this port is configuration-independent
 ProvidePort DCMServices DCMServices;
 //see configuration parameter DcmDspSecurityRow
 RequirePort SecurityAccess <LEVEL> SecurityAccess <LEVEL>;
 //see configuration parameter DcmDspData
RequirePort DataServices <Data> DataServices <Data>;
ProvidePort DataServices <Data> DataServices <Data>; // Only if
the data can be written and DcmDspDataUsePort is set to
USE DATA SENDER RECEIVER
  //see configuration parameter DcmDspVehInfoData
 RequirePort InfotypeServices <VEHINFODATA>
     InfotypeServices <VEHINFODATA>;
 // see configuration parameter DcmDspTestResultTid for <TID> and
 //DcmDspTestResultObdmidTid for <OBDMID>
 RequirePort DTRServices DtrServices <OBDMID> <TID>;
```

R4.0 Rev 3

```
//see configuration parameter DcmDspRoutine
  RequirePort RoutineServices <ROUTINENAME>
    RoutineServices <ROUTINENAME>;
  //see configuration parameter DcmDspRequestControl
  RequirePort RequestControlServices <TID>
    RequestControlServices <TID>;
  //see configuration parameter DcmDslCallbackDCMRequestService
  RequirePort CallbackDCMRequestServices
    CallbackDCMRequestServices <SWC>;
  //see configuration parameter
DcmDslServiceRequestManufacturerNotication
  RequirePort ServiceRequestNotification
    RequestManufacturerNotification <SWC>;
//see configuration parameter DcmDslServiceRequestSupplierNotication
  RequirePort ServiceRequestNotification
    ServiceRequestSupplierNotification <SWC>;
//see configuration parameter DcmDspDidExtRoe
  ProvidePort DCM Roe DCM Roe <SWC>; ... // see configuration parameter
DcmDspDidExtRoe
  RequirePort ROEServices ROEServices <SWC>;
//see configuration parameter DcmDspRoe
  RequirePort GeneralRequiredROEServices GeneralRequiredROEServices;
  ProvidePort GeneralProvidedROEServices GeneralProvidedROEServices;
//Interface containing the DEM operation ClearDtc
RequirePort Dem/DcmIf Dcm;
//see configuration parameter DcmDspDidRange
RequirePort DataServices DIDRange <Range>
DataServices DIDRange <Range> ;
//Note: When service 0x19 subfunctions 0x14 is used (call to
//Dem GetNextFilteredDTCAndFDC), the following is defined:
//Non-DEM-internal calculated fault detection counters are typically
//requested from SW-Cs through the RTE. To indicate an equivalent
call-tree //for these runables, a work-around is used: The DCM main
function //specifies a trigger to the DEM interface GeneralEvtInfo
(operation //GetFaultDetectionCounter), which triggers the according
□ehavior (refer to //RunnableEntity GetFaultDetectionCounter,
chapter "Service Interface //DiagnosticInfo & General" in DEM SWS)."
RequirePort Dem/CallbackGetFaultDetectCounter CBFaultDetectCtrDummy
(The client-server interface can be used from the DEM.)
RunnableEntity MainFunction
```

symbol "Dcm MainFunction"

canbeInvokedConcurrently = FALSE SSCP = port CBFaultDetectCtrDummy, GetFaultDetectionCounter Connector from CBFaultDetectCtrDummy to Dem/GeneralEvtInfo }

# 8.9 External diagnostic service processing

The following chapter applies only to external processed diagnostic services.

# 8.9.1 Dcm\_ExternalSetNegResponse

#### Dcm761

Service name:	Dcm_ExternalSetNegResponse	
Syntax:	void Dcm_ExternalSetNegResponse(     Dcm_MsgContextType* pMsgContext,     Dcm_NegativeResponseCodeType ErrorCode )	
Service ID[hex]:	0x30	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	pMsgContext	Message-related information for one diagnostic protocol identifier
	ErrorCode	NRC to be sent in the negative response in case of failure.
Parameters (inout):	None	
Parameters (out):	None	
Return value:	None	
Description:	Used by service interpreter outside of DCM to indicate that a the final response shall be a negative one. Dcm_ExternalSetNegResponse will not finalize the response processing.	

]()

# 8.9.2 Dcm\_ExternalProcessingDone

#### Dcm762 [

Service name:	Dcm_ExternalProcessingDone
Syntax:	void Dcm_ExternalProcessingDone(     Dcm_MsgContextType* pMsgContext )
Service ID[hex]:	0x31
Sync/Async:	Synchronous

R4.0 Rev 3

Reentrancy:	Non Reentrant		
Parameters (in):	pMsgContext Message-related information for one diagnostic protocol identifier		
Parameters (inout):	None		
Parameters (out):	None		
Return value:	None		
•	Used by service interpreter outside of DCM to indicate that a final response can be sent.		

]()

# 8.9.3 < Module > \_ < Diagnostic Service >

#### Dcm763 [

Service name:	<module>_<diagnostic< td=""><td>:Service&gt;</td></diagnostic<></module>	:Service>	
Syntax:	Std_ReturnType <module>_<diagnosticservice>(     Dcm_OpStatusType OpStatus,     const Dcm_MsgContextType* pMsgContext )</diagnosticservice></module>		
Service ID[hex]:	0x32		
Sync/Async:	Asynchronous		
Reentrancy:	Reentrant		
Parameters (in):	OpStatus	DCM_INITIAL: All In-parameters are valid DCM_CANCEL: All In-parameters are set to 0x0	
	pMsgContext	Message-related information for one diagnostic protocol identifier The pointers in pMsgContext shall point behind the SID	
Parameters (inout):	None		
Parameters (out):	None		
Return value:	Std_ReturnType	E_OK: Request was successful E_NOT_OK: Request was not successful E_PENDING: Request is not yet finished	
Description:	Callout function.  DCM shall call this callout function as soon as valid message is received on relevant DcmRxPduld on SID level.  The usecase of multiple diagnostic protocols will be possible by using different arguments and the function shall be programmed in a way at it is reentrant. Caller is responsible for the lifetime of the argument pMsgContext.  The name of the callout is defined within parameter DcmDsdSidTabFnc		

1()

**Dcm732** For the first call of <Module>\_<DiagnosticService> the opStatus shall be set to DCM\_INITIAL\_()

Dcm733 The DCM shall not accept further requests (on same or lower priority) until the application calls <code>Dcm ExternalProcessingDone</code> to finalize the processing. Dcm-internal timeout handling (based on RCR-RP limitation) may lead to a cancellation of the external diagnostic service processing ()

Dcm734 [In case Dcm ExternalProcessingDone is called in the context of <Module> <DiagnosticService> the processing (including the start of the response) transmission) shall be processed within the current Dcm MainFunction cycle (()

**Dcm735** In case of cancellation the API <Module> <DiagnosticService> is called again with the parameter opStatus set to DCM CANCEL ()

**Dcm738** The DCM shall not use the opStatus parameter DCM FORCE RCRRP OK in the API < Module > < DiagnosticService > (()

**Dcm760** The return of DCM E PENDING shall do a re-triggering (e.g. in the next MainFunction cycle). Independent of any return value

Dcm ExternalProcessingDone is still necessary to finalize the processing ()

# 8.9.4 < Module > \_ < Diagnostic Service > \_ < SubService >

#### Dcm764 [

Service name:	<module>_<diagnosti< td=""><td>icService&gt;_<subservice></subservice></td></diagnosti<></module>	icService>_ <subservice></subservice>	
Syntax:	Std_ReturnType <module>_<diagnosticservice>_<subservice>(     Dcm_OpStatusType OpStatus,     const Dcm_MsgContextType* pMsgContext )</subservice></diagnosticservice></module>		
Service ID[hex]:	0x33		
Sync/Async:	Asynchronous		
Reentrancy:	Reentrant		
·	OpStatus	DCM_INITIAL: All In-parameters are valid DCM_CANCEL: All In-parameters are set to 0x0	
Parameters (in):	pMsgContext	Message-related information for one diagnostic protocol identifier The pointer in pMsgContext shall point behind the SubFunction	
Parameters (inout):	None		
Parameters (out):	None		
Return value:	Std_ReturnType	E_OK: Request was successful E_NOT_OK: Request was not successful E_PENDING: Request is not yet finished	
Description:	Callout function.  If a DcmDsdSubServiceFnc is configured for the received subservice, the DCM shall call this callout function as soon as this subservice is requested.  The usecase of multiple diagnostic protocols will be possible by using different arguments and the function shall be programmed in a way that it is reentrant.  Caller is responsible for the lifetime of the argument pMsgContext.  The name of the callout is defined within parameter DcmDsdSubServiceFnc.		

# 8.10 Internal interfaces (not normative)

The following interfaces are used in the DCM SWS in order to improve the understanding of the DCM module behavior. An implementation is not required to use these interfaces.

## 8.10.1 DslInternal\_SetSecurityLevel

void

DslInternal SetSecurityLevel(Dcm SecLevelType SecurityLevel)

This function sets a new security level value in the DCM module. NOTE: for the definition of the parameter, refer to Dcm GetSecurityLevel()

## 8.10.2 DslInternal\_SetSesCtrlType

void

DslInternal SetSesCtrlType(Dcm SesCtrlType SesCtrlType)

This function sets a new session control type value in the DCM module. NOTE: for the definition of the parameter, refer to the Dcm GetSesCtrlType()

# 8.10.3 DspInternal\_DcmConfirmation

void

DspInternal\_DcmConfirmation(Dcm\_IdContextType idContext, uint16 SourceAddress
Dcm ConfirmationStatusType status)

This function confirms the successful transmission or a transmission error of a diagnostic service. This is the right time to perform any application state transitions.

# 8.10.4 DslInternal\_ResponseOnOneEvent

This API executes the processing of one event, requested internally in the DCM.

# 8.10.5 DslInternal\_ResponseOnOneDataByPeriodicId

Dcm\_StatusType
DslInternal\_ResponseOnOneDataByPeriodicId(uint8 PeriodicId)

This API provides the processing of one periodic ID event, requested internally in the DCM. The frequency of calling this function depends on the rate given in the original ReadDataByPeriodicID request (parameter transmissionMode).

## 8.10.6 DsdInternal\_StartPagedProcessing

void

DsdInternal\_StartPagedProcessing(const Dcm\_MsgContextType\*
pMsgContext)

With this API, the DSP submodule gives the complete response length to the DCM module and starts paged-buffer handling. This API starts no transmission!

## 8.10.7 DspInternal\_CancelPagedBufferProcessing

void

DspInternal CancelPagedBufferProcessing()

DCM informs DSP, that processing of paged-buffer was cancelled due to errors. Upon this call, DSP is not allowed to process further on paged-buffer handling.

## 8.10.8 DsdInternal\_ProcessPage

void

DsdInternal ProcessPage(Dcm MsgLenType FilledPageLen)

DSP requests transmission of filled page

## Sequence diagrams

## 9.1 Overview

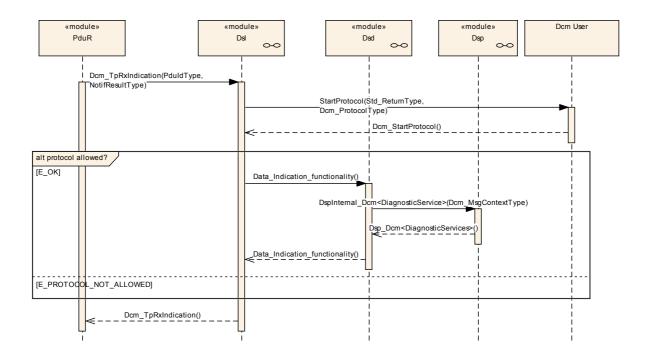

For clarification, the following sequence diagrams don't represent the full communication mechanism between the DCM module and the PduR module. This is to keep the sequence diagrams simple.

Before the Dcm TpRxIndication() call, the PduR module will ask the DCM module for buffer calling Dcm StartOfReception() and by Dcm CopyRxData(). This exchange is not shown on the next sequence diagrams. After a PduR DcmTransmit() request from the DCM module to the PduR module, data exchanges with Dcm CopyTxData() service, are not shown in the sequence diagrams.

The function Xxx StartProtocol() shall be called with the very first diagnostic request.

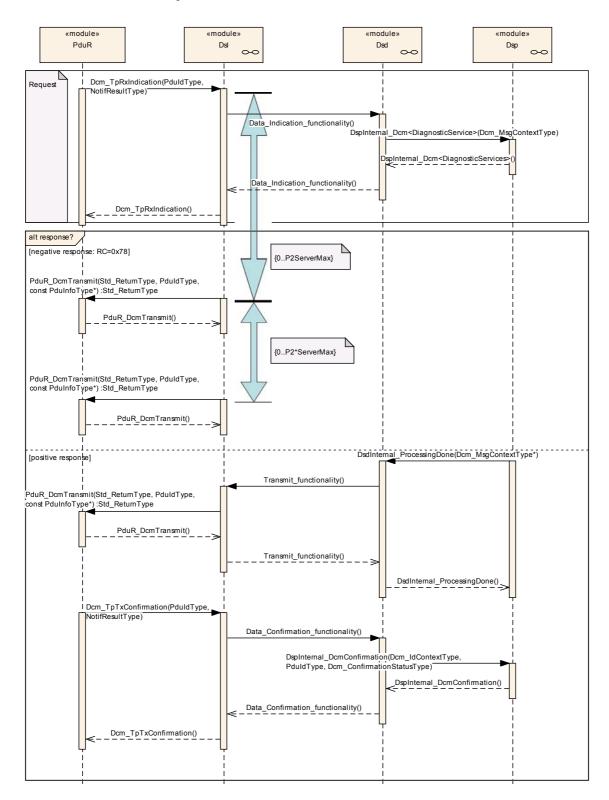

# 9.2 DSL (Diagnostic Session Layer)

## 9.2.1 Start Protocol

## 9.2.2 Process Busy behavior

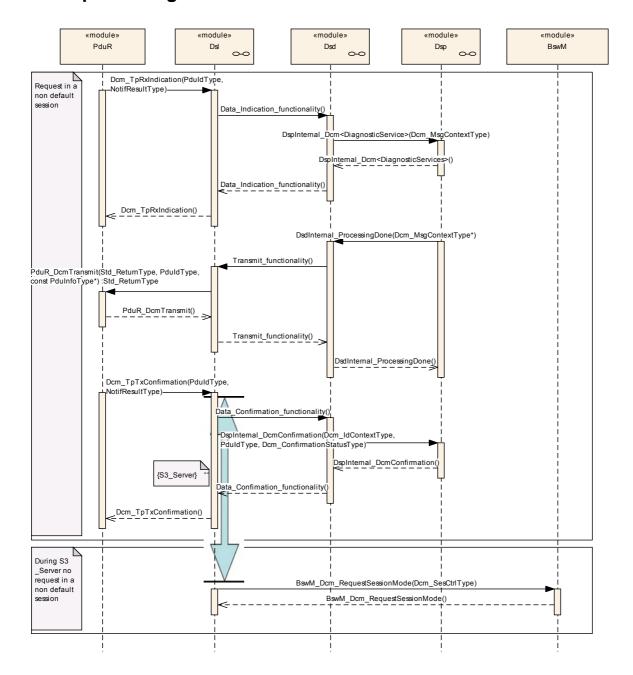

Internally, the DSL submodule calculates the time to response the tester. In the case DSP submodule doesn't close the Dcm ExternalProcessingDone() (in case of normal response handling) or DsdInternal ProcessPage() (in case of paged-buffer handling) during the

P2ServerMax and/or P2\*ServerMax, the DSL submodule sends a negative response (requestCorectlyReceived-ResponsePending) independently.

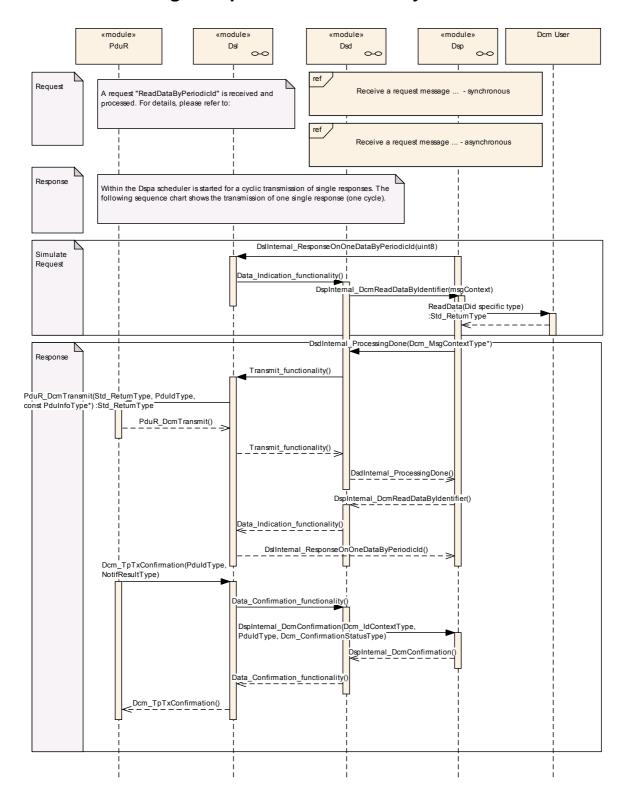

## 9.2.3 Update Diagnostic Session Control when timeout occurs

The DSL submodule resets session control value to default, if in a non-default session S3server timeout occurs. S3server timeout timer will be started with every data confirmation from the PduR module.

## 9.2.4 Process single response of ReadDataByPeriodicIdentifier

The DSP submodule requests sampling and transmission of Periodic Identifier data, when an event to Periodic Identifier occurs (i. e. a given time period is over). The DSP submodule initiates the sending of one periodic identifier calling the function ResponseOnOneDataByPeriodicId() provided by the DSL submodule.

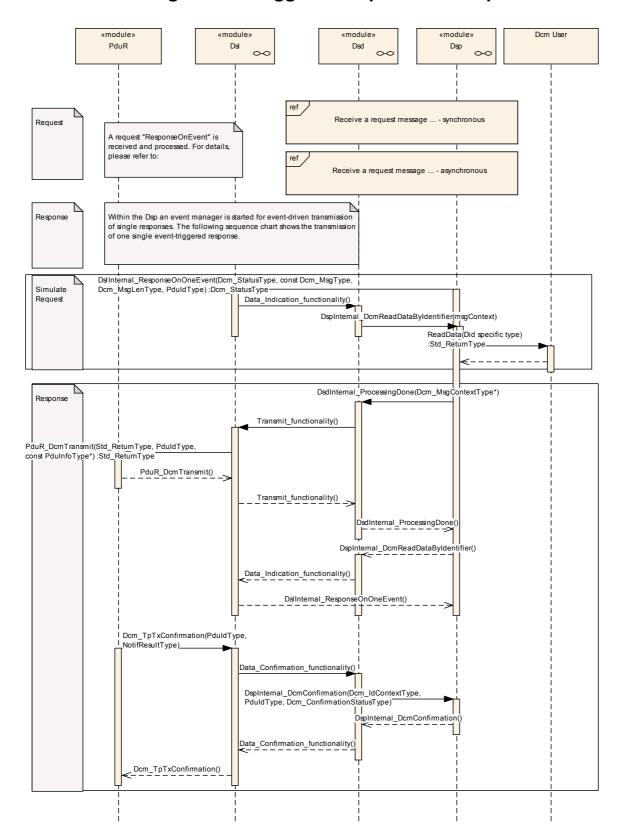

Within this function the DSL submodule simulates a "ReadDataByldentifier" request for the given PeriodicId. The High byte of the DataIdentifier shall be set to 0xF2 as specified in [11]) and the low byte is set to value of the PeriodicId.

The ReadData interfaces of the corresponding Datas of the DID are called to get the DID value.

The DCM module is not able to receive for the same periodic identifier another event request from the DSP submodule, unless the confirmation of the current transmission is received.

## 9.2.5 Process single event-triggered response of ResponseOnEvent

The DSP submodule requests transmission of ResponseOnEvent data, when ROE event occurs (DslInternal ResponseOnOneEvent()).

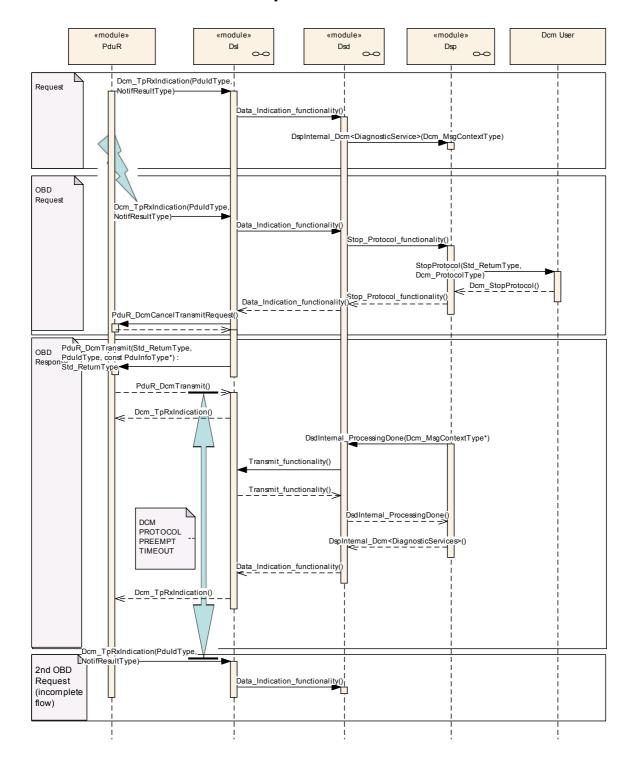

Within this function the DSL submodule simulates a corresponding diagnostic request that has already been registered. This request will be processed by the DSP submodule.

The ReadData interfaces of the corresponding Datas from the DID is called to get the DID value.

The DCM module will not be able to process multiple event-triggered responses at one time.

## 9.2.6 Process concurrent requests

On reception of OBD request in parallel to processing of a normal diagnostic request (e.g enhanced diagnostic protocol, customer diagnostic protocol), running diagnostic request will be preempted. This is due to the configured higher priority of OBD protocol (see configuration parameter *DcmDslProtocolPriority*).

The following is processed on reception of 1st OBD request:

- The Application is informed of the protocol stop (done with Xxx StopProtocol()) and resets to a stable state (e.g. switch of digital los,..).

- Lower Layer is requested to cancel ongoing transmission on the same N-PDU (done with PduR DcmCancelTransmitRequest()).
- If the DCM is not able to switch fast enough from non OBD to OBD protocol, the DSL submodule responses with a negative response "BusyRepeatRequest" (NRC 0x21) to OBD tester.

It is in the responsibility of the system designer to ensure that the legislative timings are satisfied.

- Timeout tracking of the Application finishes is started (timeout value configured in parameter **DcmDsIProtocolPreemptTimeout** of the preempting protocol (here OBD protocol)).

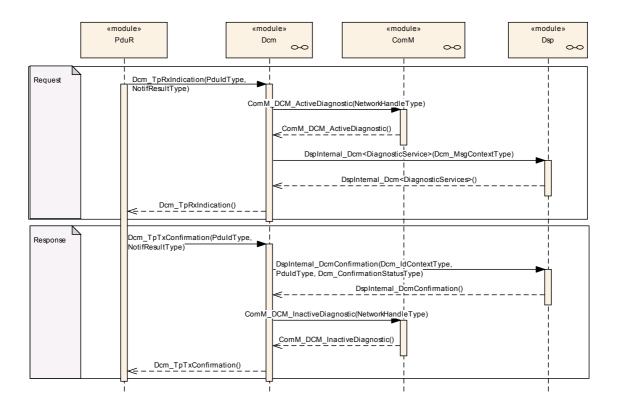

As long as the DSP submodule is not finished (finish is indicated with Dcm ExternalProcessingDone()) or no timeout occurs, the DSL submodule responses with negative response "BusyRepeatRequest".

With receiving Dcm ExternalProcessingDone(), the DSL submodule will not transmit a response to old request. There will also not given any negative response to inform first tester about preemption of diagnostic request.

If the DSP submodule triggers no Dcm ExternalProcessingDone(), the DSL submodule runs into timeout and switches directly to further processing of preempting protocol.

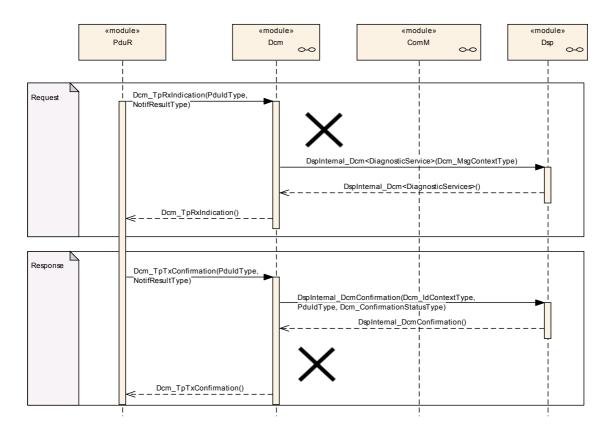

## 9.2.7 Interface to ComManager

### 9.2.7.1 Handling in Default Session

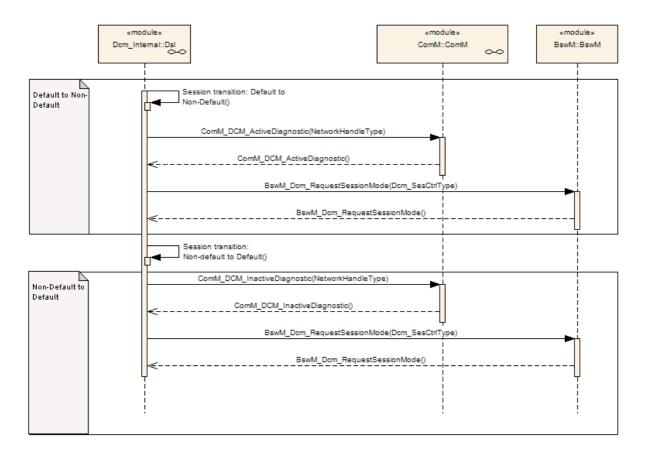

## 9.2.7.2 Handling in Non-Default Session

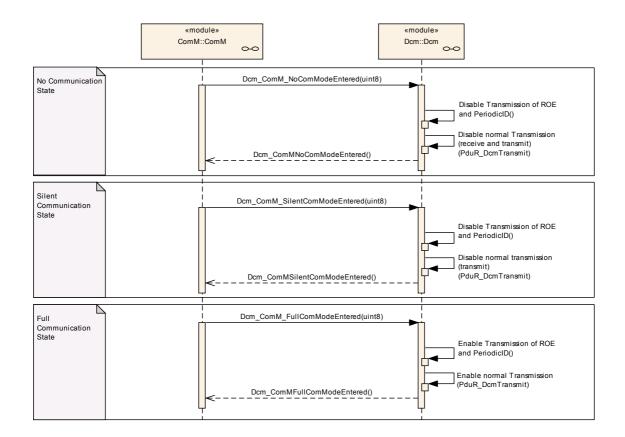

## 9.2.7.3 Session transitions

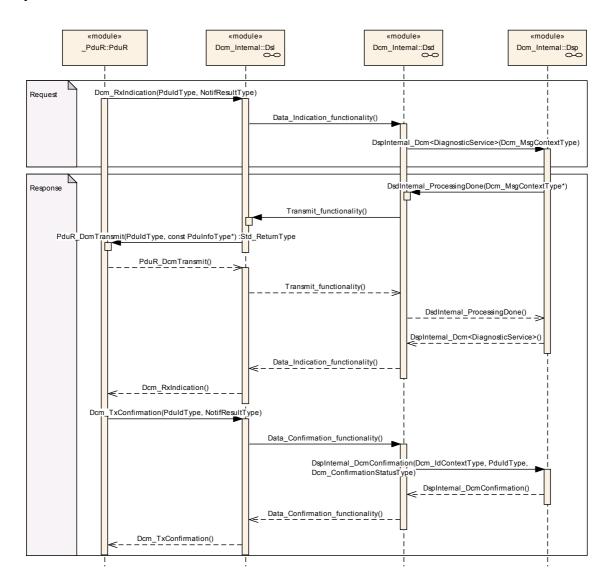

## 9.2.7.4 Communication States

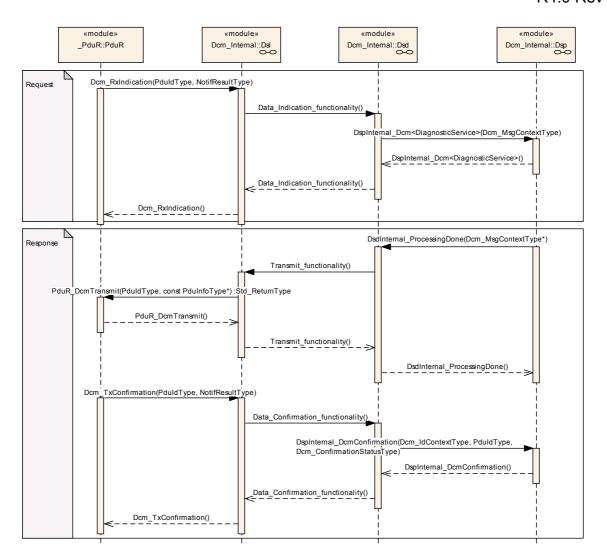

# 9.3 DSD (Diagnostic Service Dispatcher)

Receive a request message and transmit a positive response message synchronous transmission

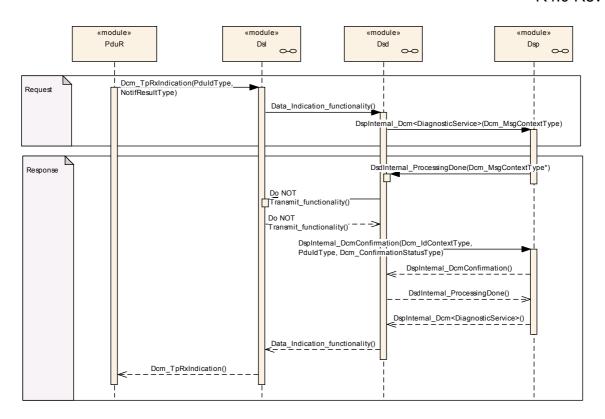

Receive a request message and transmit a positive response message asynchronous transmission

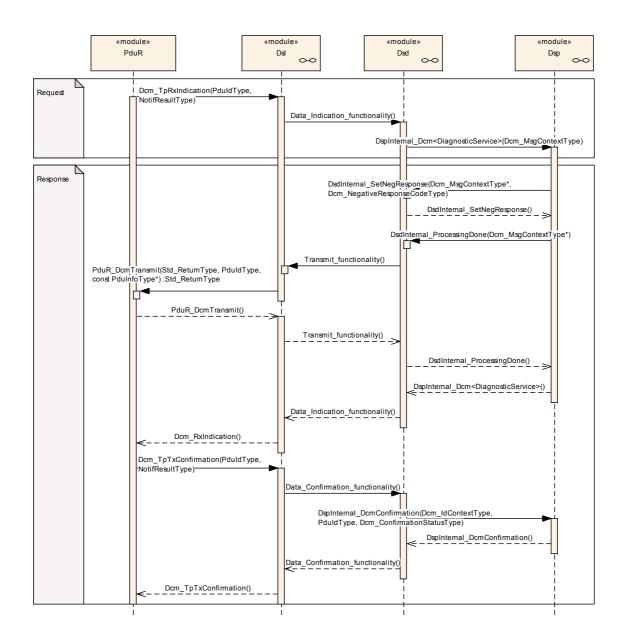

Receive a request message and suppress a positive response

V4.2.0 R4.0 Rev 3

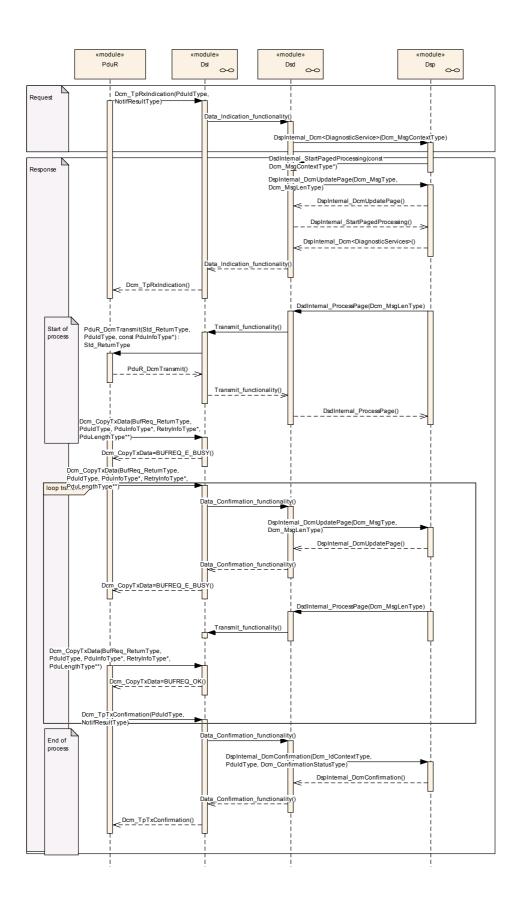

# 9.3.1 Receive request message and transmit negative response message

# 9.3.2 Process Service Request with paged-buffer

The following flow is processed in case no error occurs on the Application side:

## Start of process:

- 4) DsdInternal StartPagedProcessing(): With this API, the DSP submodule gives the complete response length to the DCM module and starts paged-buffer handling. This API starts no transmission!
- 5) UpdatePage(): The DCM module requests data to be transmitted.
- 6) DsdInternal ProcessPage(): With this API, the DSP submodule requests transmission of the current page.
- 8) PduR DcmTransmit(): The DCM module requests transmission to the lower lavers.
- 9) Dcm CopyTxData(): The buffer is filled and the DCM module shall return "BUFREQ OK"(10).

## Start of the loop:

- 11) Dcm CopyTxData(): The PduR module requests the buffer but the buffer is not filled by the DSP submodule.
- 12 + 13) UpdatePage: The DCM module requests the DSP submodule to fill the next page.
- 14) By returning "BUFREQ E BUSY", the DCM module indicates that the buffer has to be filled by the DSP submodule.
- 15) DsdInternal ProcessPage(): With this API, the DSP submodule requests transmission of the current page.
- 17) Then, on the next call of Dcm CopyTxData() the buffer is filled and the DCM module shall return "BUFREQ OK" (18).

LOOP: The flow 10 to 18 is repeated as long data can be sent. End of the loop:

 $n-2 \rightarrow n$ ) Dcm TpTxConfirmation() When all data is send, the PduR module indicates the sending with a confirmation, which is given to the DSP submodule. The APIs 4, 5 and 6 are needed only for paged-buffer transmission. Page buffer timeout handling:

The DCM module reacts in the following described way, when the DSP submodule starts paged-buffer handling, but is not able to process further on filling the response data. E.g. there are problems to access data from an EEPROM device.

When providing the Pagebuffer to the DSP submodule (13: UpdatePage()), the DCM module timeout supervision. If timeout (value configured starts **DcmPagedBufferTimeout**) occurs, before the DSP submodule requests next page (DsdInternal ProcessPage()) following error handling is carried out in the DCM module:

- The DCM module stops further processing of paged-buffer (item 15),
- DSP The DCM module requests the submodule (14: DspInternal CancelPagedBufferProcessing()) to stop further processing of PagedBuffer, and
- The DCM module will cancel ongoing transmission in lower layers (done with return value BUFREQ E NOT OK in next Dcm CopyTxData() request, item 17).

# 9.4 DSP (Diagnostic Service Processing)

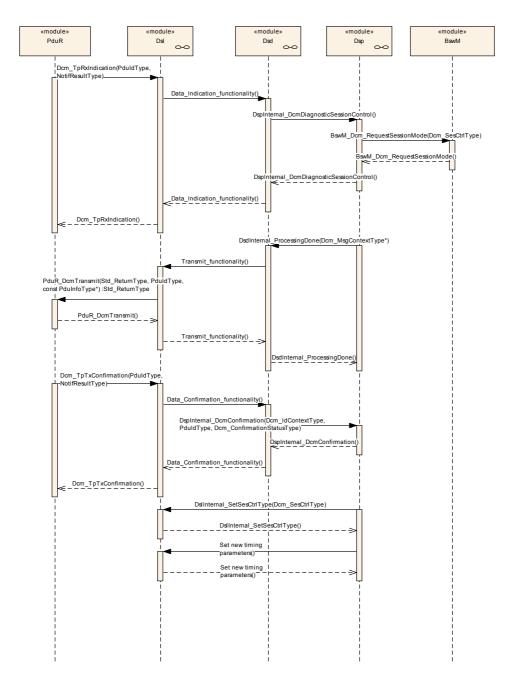

9.4.1 Interface DSP - DEM (service 0x19, 0x14, 0x85)

Please refer to Section 9. In [7].

9.4.2 Interface special services

9.4.2.1 Process Diagnostic Session Control

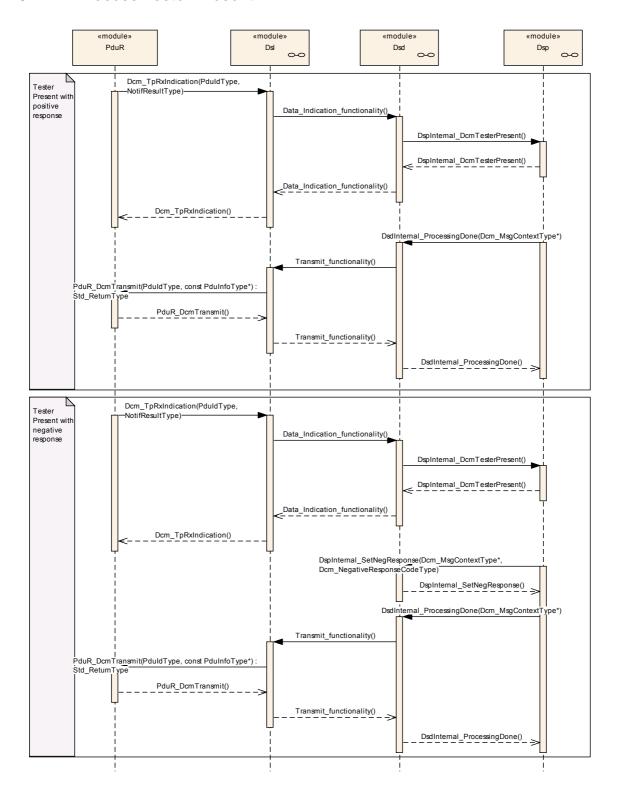

On a Diagnostic Session Control request from a tester, the DSP submodule requests the Application to get the permission to change the session.

With the permission from the Application, a positive response is given to the PduR module. In the data confirmation function the new session type and the new timing values are set.

The DSL submodule indicates the session change to the Application (Xxx ChangeIndication()).

## 9.4.2.2 Process Tester Present

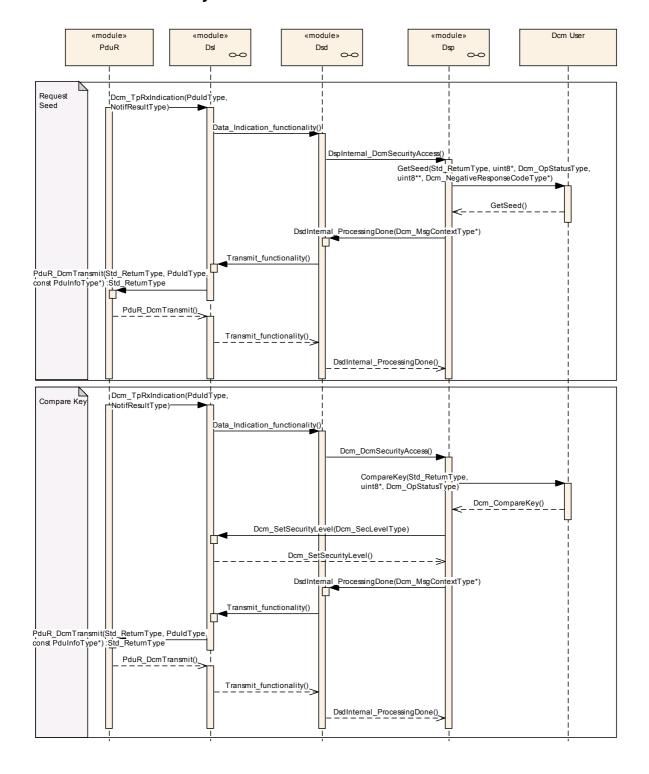

Above sequence diagram shows processing of TesterPresent commands, which are not of type functional addressed with subfunction 0x80. These TesterPresent commands are interpreted in the DSL submodule (more details can be found in Section 7.2.4.3 Concurrent "TesterPresent" ("keep alive logic"))

All the other TesterPresent commands are processed in the following way: On a command TesterPresent the DSD submodule calls the DSP submodule with the function TesterPresent(). The sequence chart also shows the case when an error occurs and a negative response is sent.

## 9.4.2.3 Process Security Access

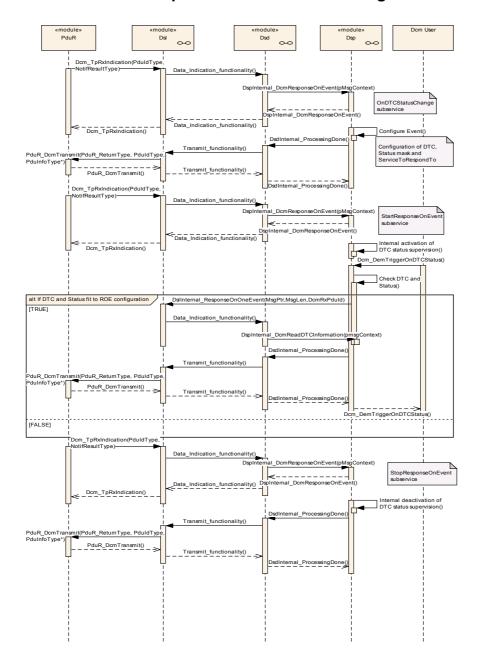

To get the security access, the DSD submodule has to call the DSP submodule to get the seed value from the application. If no error is detected, the seed value is sent in the positive response.

In a second step, the DSP submodule gets the key calculated by the tester and requests the application to compare this key with the internal calculated key. If no error occurs, the new access type is set in the DSL submodule and a positive response is sent.

## 9.4.2.4 Process ResponseOnEvent OnDtcChange

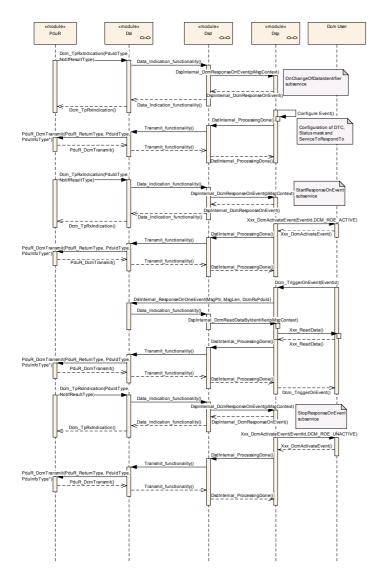

Above sequence diagram shows processing of ResponseOnEvent service for subservice OnDtcChange.

After configuration and activation of the event by the service ResponseOnEvent, the DCM checks the status of the configured DTC on every call to interface Dcm\_DemTriggerOnDTCStatus() in order to identify if the event shall be trigger. This interface is called by DEM for any DTC status change and independing of the activation/unactivation of ResponseOnEvent.

# 9.4.2.5 Process ResponseOnEvent OnChangeOfDataIdentifier

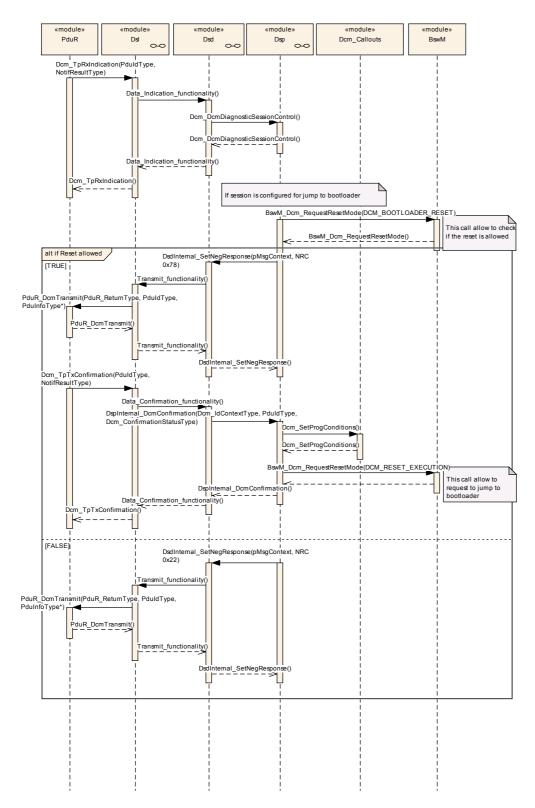

Above sequence diagram shows processing of ResponseOnEvent service for subservice OnChangeOfDataIdentifier in the case the event is externally managed (The event can be internally managed, but is not describe in this diagram).

After configuration and etxernal activation of the event by the service ResponseOnEvent, the DCM wait to be trigger by the external module managing this DID.

## 9.4.2.6 Process Jump to Bootloader

Above sequence diagram shows processing of a jump to bootloader on reception of DiagnosticSessionControl.

On reception of DiagnosticSessionControl, the DCM checks if the requested session is configured to trigger a jump to bootloader. In positive case, the DCM start the jump to bootloader process:

- Transmission of NRC 0x78 (ResponsePending)
- On confirmation of transmission of NRC 0x78, the DCM calls the callout DcmSetProgConditions to store all information needed for the bootloader
- DCM request the jump to bootloader to BswM module

## 10 Configuration specification

#### 10.1 How to read this section

In addition to this section, it is highly recommended to read the documents:

- AUTOSAR Layered Software Architecture [5]
- AUTOSAR ECU Configuration Specification [6]. This document describes the AUTOSAR configuration methodology and the AUTOSAR configuration metamodel in detail.

The following is only a short survey of the topic and it will not replace the ECU Configuration Specification document.

### 10.1.1 **Configuration and configuration parameters**

Configuration parameters define the variability of the generic part(s) of an implementation of a module. This means that only generic or configurable module implementation can be adapted to the environment (software/hardware) in use during system and/or ECU configuration.

The configuration of parameters can be achieved at different times during the software process: before compile time, before link time or after build time. In the following, the term "configuration class" (of a parameter) shall be used in order to refer to a specific configuration point in time.

Pre-compile time specifies whether the configuration parameter shall be of configuration class Pre-compile time or not.

	<u> </u>
Label	Description
х	The configuration parameter shall be of configuration class Pre-compile time.
	The configuration parameter shall never be of configuration class Precompile time.

specifies whether the configuration parameter shall be of configuration Link time class Link time or not.

Label	Description
Х	The configuration parameter shall be of configuration class Link time.
	The configuration parameter shall never be of configuration class Link time.

specifies whether the configuration parameter shall be of configuration Post Build class Post Build or not.

Label	Description
х	The configuration parameter shall be of configuration class Post Build and
	no specific implementation is required.
L	Loadable – the configuration parameter shall be of configuration class Post
	Build and only one configuration parameter set resides in the ECU.
М	Multiple – the configuration parameter shall be of configuration class Post
	Build and is selected out of a set of multiple parameters by passing a

Label	Description
	dedicated pointer to the init function of the module.
	The configuration parameter shall never be of configuration class Post Build.

#### 10.1.2 **Variants**

The DCM module has the following variants:

[Dcm171] \( \text{VARIANT-PRE-COMPILE: Only parameters with "Pre-compile time"} \) configuration are allowed in this variant. (BSW00396)

[Dcm172] \ VARIANT-LINK-TIME: Only parameters with "Pre-compile time" and "Link time" are allowed in this variant. (BSW00396)

[Dcm173] 「VARIANT-POST-BUILD: Parameters with "Pre-compile time", "Link time" and "Post-build time" are allowed in this variant. (BSW00396)

In variant POST-BUILD the pre-compile parameter shall be used to enable or disable the functionality (e.g. ROE transmission DCM ROE ENABLED). With the post build parameter the functionality shall be configured (e.g. DCM ROE TRANS TYPE). Please note: This pre-compile configuration parameters are mandatory for all variants. The pre-compile parameter shall be used to enable or disable DCM functionality (e.g. ROE transmission DCM ROE ENABLED) or are DCM global configuration data that shall be configured at pre complile time (e.g. memory influence).

#### 10.1.3 **Containers**

The Containers structure the set of configuration parameters. This means:

- all configuration parameters are kept in containers.
- (sub-) containers can reference (sub-) containers. It is possible to assign a multiplicity to these references. The multiplicity then defines the possible number of instances of the contained parameters.

Containers have names indicating what kinds of parameters are handled inside.

### **DCM** configurations 10.2

### 10.2.1 **Dcm**

Module Name	Dcm
Module Description	Configuration of the Dcm (Diagnostic Communications Manager) module.

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
DcmConfigSet	1	This container contains the configuration parameters and sub containers of the DCM module supporting multiple configuration sets. This container is a MultipleConfigurationContainer, i.e. this container and its sub-containers exist once per configuration set.	

### **DcmConfigSet** 10.2.2

SWS Item	Dcm819_Conf:	
Container Name	DcmConfigSet [Multi Config Container]	
Description	This container contains the configuration parameters and sub containers of the DCM module supporting multiple configuration sets.  This container is a MultipleConfigurationContainer, i.e. this container and its sub-containers exist once per configuration set.	
Configuration Parameters		

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
DcmDsd	1	These parameters apply to Diagnostic Service Dispatcher. All parameters for all service dispatchers are included in this one configuration container. There must always be one service dispatcher in a DCM.	
DcmDsl	1	These parameters apply to a Diagnostic Session Layer. There may be a parameter set (DSL Configuration) per protocol. upperMultiplicity: Each DCM configuration must have exactly one DSL configuration. lowerMultiplicity: Each DCM configuration must have exactly one DSL configuration.	
DcmDsp		These parameters apply to Diagnostic Service Processing. There will always be one set of these parameters per DCM.	
DcmGeneral	1	This container contains the configuration (parameters) for Component wide parameters	
DcmPageBufferCfg		This container contains the configuration (parameters) for Page Buffer handling	
DcmProcessingConditions		This container contains the configuration ( DSP parameter) for mode arbitration functionality of the Dcm	

#### **DcmDsd** 10.2.3

SWS Item	Dcm688_Conf:
Container Name	DcmDsd
Description	These parameters apply to Diagnostic Service Dispatcher. All parameters for all service dispatchers are included in this one configuration container. There must always be one service dispatcher in a DCM.
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DcmDsdServiceTable	I /	This container contains the configuration (DSD parameters) for Service Identifier Table.

#### **DcmDsdServiceTable** 10.2.4

SWS Item	Dcm732_Conf:
Container Name	DcmDsdServiceTable
II JASCRINTION	This container contains the configuration (DSD parameters) for Service Identifier Table.
Configuration Parameters	

SWS Item	Dcm736_Conf :	Dcm736_Conf:			
Name	DcmDsdSidTabld	DcmDsdSidTabId			
Description		Due the fact of using one or more service tables the member of the Service Identifier Table includes a unique id for the Service Identifier Table.

SWS Item	Dcm728_Conf :	Dcm728_Conf :			
Name	DcmTimStrP2StarServerAdj	DcmTimStrP2StarServerAdjust			
Description	This parameter is used to gurantee that the DCM response is available on the bus before reaching P2*. This parameter value in milliseconds has to be configured as multiple of DcmTaskTime and is minimum in the timing handling of P2*. The AUTOSAR configuration standard is to use SI units, so this parameter is defined as a float value in seconds. DCM configuration tools must convert this float value to the appropriate value format for the use in the software implementation of DCM.

Name	DcmDspRoeInterMessageT	DcmDspRoeInterMessageTime				
Description	It is used for the delay between transmissions and between AUTOSAR configuration state defined as float value in sections float value to the appropriate to the sections.	Provide the minimum time in ms between two transmissions of ROE event. It is used for the delay between two different consecutive Roe transmissions and between two transmissions of the retry mechanism. The AUTOSAR configuration standard is to use SI units, so this parameter is defined as float value in seconds. DCM configuration tools must convert this float value to the appropriate value format for the use in the software implementation of DCM. min: A negative value is not allowed.

## No Included Containers

#### **DcmModeRule** 10.2.78

SWS Item	Dcm925_Conf:
Container Name	DcmModeRule
Description	This container contains the configuration of a mode rule which represents a logical expression with DcmModeCondistions or other DcmModeRules as arguments.  All arguments are processed with the operator defined by DcmLogicalOperator, for instance: Argument_A AND Argument_B AND Argument_C
Configuration Parameters	

SWS Item	Dcm926_Conf:			
Name	DcmLogicalOperator			
Description	This parameter specifies the logical operator to be used in the logical expression. If the expression only consists of a single condition this parameter shall not be used.			
Multiplicity	01	01		
Туре	EcucEnumerationParamDef	EcucEnumerationParamDef		
Range	DCM_AND	DCM AND		
	DCM_OR			
ConfigurationClass	Pre-compile time	Х	All Variants	
	Link time			
	Post-build time			
Scope / Dependency	scope: Instance			

SWS Item	Dcm949_Conf:				
Name	DcmModeRuleNrcValue	DcmModeRuleNrcValue			
Description	Optional parameter which or rule condition is not valid.	Optional parameter which defines the NRC to be sent in case the mode rule condition is not valid.			
Multiplicity	01	01			
Туре	EcucIntegerParamDef	EcucIntegerParamDef			
Range	0 255	0 255			
Default value					
ConfigurationClass	Pre-compile time	X	VARIANT-PRE-COMPILE		
	Link time	X	VARIANT-LINK-TIME		
	Post-build time				
Scope / Dependency	scope: ECU				

SWS Item	Dcm927_Conf :				
Name	DcmArgumentRef				
Description		This is a choice reference either to a mode condition or a an other mode rule serving as sub-expression.			
Multiplicity	1*	1*			
Туре	Choice reference to [ DcmN	lodeC	ondition , DcmModeRule ]		
ConfigurationClass	Pre-compile time	Pre-compile time X All Variants			
	Link time				
	Post-build time	Post-build time			
Scope / Dependency

#### **Protocol Configuration Example** 10.3

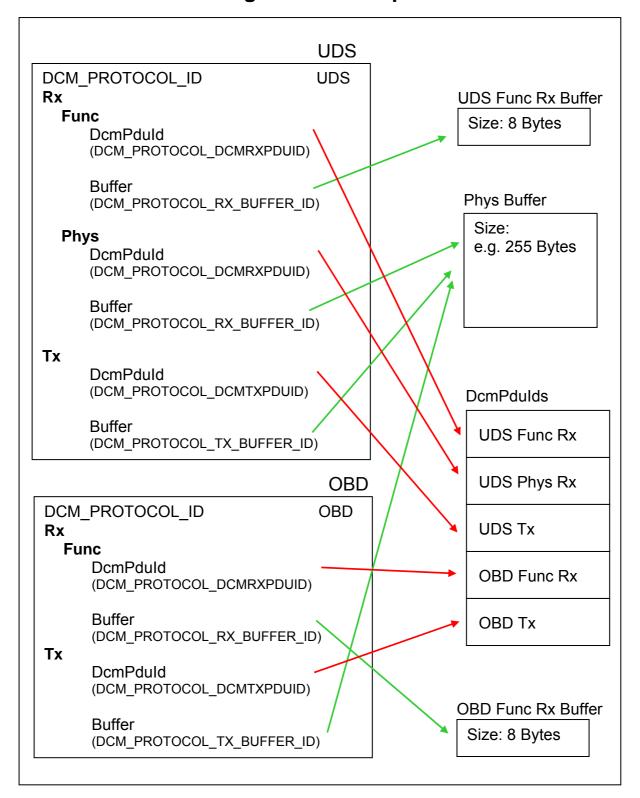

Figure 10 Examples of protocol configuration with focus on buffer / DcmPduld settings

Above example shows protocol configuration at the use cases examples OBD and UDS (used for customer enhanced diagnosis). It is assumed that for UDS

communication, there are functional and physical requests. There will be separate DcmPduRxlds for functional and physical reception.

Concerning buffer configuration it is proposed to use a separate buffer for the functional requests. This in correspondence to support the keep alive logic with functional addressed TesterPresent commands.

It is also proposed to use a separate receive buffer for the OBD commands. This in reference to support the protocol switch functionality.

It is allowed to share for both protocols the transmit buffer.

Please note:

The DcmDslProtocolRx has two possible configurations:

- functional
- physical

The physical shall have a 1:1 (or 1:0) dependency to the DcmDslMainConnection. (which means: **DcmDsIProtocolRxPduRef** in combination DCM PROTOCOL RX ADDR TYP = physical can exist only once per "Module") The functional shall have a 1:n dependency to the DcmDslMainConnection. (which means: **DcmDsIProtocolRxPduRef** in combination DCM PROTOCOL RX ADDR TYP = functional can exist several times per "Module")

The DcmDslProtocolTx shall exist only once per "Module"

#### **Published Information** 10.4

[Dcm914] The standardized common published parameters as required by BSW00402 in the General Requirements on Basic Software Modules [1] shall be published within the header file of this module and need to be provided in the BSW Module Description. The according module abbreviation can be found in the List of Basic Software Modules [9]. ()

Additional module-specific published parameters are listed below if applicable.
